

RenderTotalerHTML Method (PageEngine Object)

The **RenderTotalerHTML** method returns a variant that contains HTML code for the Group Tree.

Syntax

```
variantData = object.RenderTotalerHTML (RootGroupPath, StartingChildNumber,  
PastRootLevels, MaxNodeCount, OpenGroupPath, IncludeDrillDownLinks, BaseURL, ResultType)
```

Parameters

BaseURL - The URL address of the report when it is first generated by the web server.

IncludeDrillDownLinks - Indicates whether or not drill-down hyperlinks are generated for summary values in the report.

MaxNodeCount - The maximum number of nodes to display in the Group Tree.

OpenGroupPath - An array of groups to be opened in the report.

PastRootLevels - A value indicating the number of past root levels.

ResultType - Returns CRRenderResultType (see table below) indicating whether the page will be rendered using strings or arrays.

crBSTRType 8

crUISafeArrayType 8209

RootGroupPath - Specifies an integer array that represents the root group path (separated by "/"). An empty array would represent the entire report, an array (0, 1) would represent a drill down on the second group member within the first group member (i.e., 0 = first group in Group #1 and 1 = second group in Group #2).

StartingChildNumber - Long
