

SetSessionInfo Method (DatabaseTable Object)

The **SetSessionInfo** method allows the user to log on to a secured Access session.

Syntax

```
object.SetSessionInfo SessionUserID As String, SessionPassword  
As String
```

Parameters

SessionUserID - Specifies the Access userID used to log on to an Access session.

SessionPassword - Specifies the session password for Access secured session.

Remarks

In Microsoft Access 95 and later, an Access database can have session security (also known as user-level security), database-level security, or both. If the Access database contains only session security, simply pass the session password to the SessionPassword parameter. If the Access database contains database-level security, use a linefeed character, Chr(10), followed by the database-level password. For example:

```
object.SetSessionInfo "userID", Chr(10) & "dbpassword"
```

If the Access database contains both session security and database-level security, use the session password followed by the linefeed character and the database password.

```
object.SetSessionInfo "userID", "  
"sesspswd" & Chr(10) & "dbpassword"
```

Alternately, database-level security can also be handled by assigning the database-level password to the Password parameter of the **SetLogOnInfo** Method.
