Macintosh Programmer's Workshop C++

Overview

C++isthelatestobject-oriented programminglanguagefrom AppleComputerforusewiththe MacintoshProgrammer'sWork-shop(MPW®)development environment.

Apple's implementation of C++ fully supports the industry standard for object-oriented Cas defined by AT&T's C++Release 2.0. Applehasen hanced the language to support the Macintosh Toolbox and Operating System, Object Pascal-based

functionsandprocedures (such as those found in MacApp®), and the Standard Apple Numerics Environment (SANE®). MPWC++can be debugged at the C++source level using Apple's Symbolic Application Debugging Environment (SADE®). MPWC++outperforms typical CFront implementations because it integrates portions of Apple's own MPWC compiler into CFront and addsprecompiled headers.

Applications builtusing MPW C++can run on the complete line of Apple® Macintosh® personal computers, and can take advantage of the powerful hardware found in the high-end Macintosh models. MPWC++ provides full support for object-oriented programming for C-based applications. The use of object-oriented programming techniques helps to reduce development time while it increases the reliability of the resulting applications.

Features

Benefits

Supportforobject-oriented programming	 Reduces development time Makes it easier to maintain applications Increases the reliability of applications Facilitates the creation of reusable code Offers a better model for building applications than procedural programming can provide
- BasedonAT&T's C++Release2.0	 Provides data abstraction, multiple inheritance, and message-passing capabilities Offers operator overloading and protected variables within dasses Provides strong type-checking for C-based applications
· Extensionsforthe Macintoshenvironment	 Suppliesfullaccesstothe Macintosh Toolboxand operating system Supports Object Pascalfunctions and procedures in order to be compatible with MacApp Provides access to SANE for numerical accuracy Supports SADE for C++ source-level debugging Includes Apple's Commando interface for ease of use
Integration of CFronttool with MPWandMPWC	 IncludestheMPWCscannerandpreprocessor Allows MPWC++toproducetokenizedC, resulting in reduced build times Allows the use of MultiFinder® memory for building large applications Canautomatically mark all functions and procedures in source files
- Fasterthan original CFront	 Supportsprecompiled headers, resulting in up to 50 percent reductions in build times when using MacApp Allows MPWC++ to produce to kenized C, resulting in reduced build times
- Supportformultilingual applications	 LetsyoucallObjectPascalfunctionsand procedures from MPW C++ Allows C++ to be used with MacApp, further enhancing the programmer's productivity
· Sampleprograms	 Providesexamplesoftwostand-alone, MultiFinder® "system-compatible" applications ProvidesanexampleofanMPW tool that is written in C++ Canbeusedas learning aidsoras the foundation for actual applications and tools

Product Details

Object-Oriented Language Extensions TheMPWC++system offersobject-oriented programmingtoprogrammersusing C. Multiple inheritance, operator overloading, protected variablesandmemberswithindassesarebutafew of the object-oriented facilities of MPWC++.

C++ Translator

C++sourcecodeistranslatedintoCsource code by the CF ront tool. The resulting C source codeisthen compiled by MPWC. All of this is "automated" by CPlus, an MPW script provided with MPWC++. CPlus calls both CFront and MPWC, passing appropriate parameters. Doing this results in a complete compilation of C++ sourcecode.

MPWC++usesthesamepreprocessorand scannerasMPWC.ThisallowsMPWC++to output tokenized Csource code (as well as "standard" Csource code), a capability that reduces the build times typically associated with C++.

Alarger reduction in build times is a chieved through the use of precompiled headers. Standardheaderfilesfor Cmust be recompiled eachtimetheyare needed. MPWC++provides an option for "dumping" compiled headers to a diskfilethefirsttimetheyarecompiled. Each timethese headers are needed. MPWC++can "load" them in their precompiled form. This results in savings of up to 50 percent on build timeswhenusedwithMacApp.

MPWCisavailablefromtheAppleProgrammersandDevelopersAssociation(APDA).

MPWC++workswithApple'sSymbolic Application Debugging Environment (SADE). SADE can be used at either the source or the assembly level to debugapplications and MPW

Source-Level Debugging

tools. During compilation, MPWC++can createthesymbolfilesthatareneededbySADE to debug C++ applications at the C++ sourcecodelevel. This allows C++ programmers to hamessthe powerful scripting language of SADE during the development cycle in order to further increase application reliability and decreased evelopment time.

SADEisavailablefromAPDA.

Libraries

MPWC++includeslibrariesforcomplexmath and I/O stream processing. Apple has completely redone the Complex library. It retains thefunctionality of AT&T's Complex library and expandsonit, using SANE as the basis for superiornumerical accuracy.

Unmangler

Errormessages produced while linking C++basedfilescan bevery cryptic. MPWC++ comes with a tool for converting these "mangled" errormessages into messages that are much easier to read. Also included is a resourcethatallowsthe Macs Bugdebuggerto "unmangle" C++function names.

Sample Programs

Three sample programs are included with MPW C++. Two of them are complete Macintosh applications and the third is a counting tool for MPW.Thesesamplesmakeexcellentstarting points for the development of other applications and tools.

MacApp Class Library Apple's third-generation class library, MacApp, provides an object-oriented framework that implements the standard Macintoshuser interface, including scrollable, resizable windows and multipage printing. MacApp fosters development of robust, professionalqualityapplicationsbyprovidingyouwith extensivememorymanagementsupport, exception-handlingmechanisms, support for Undocommands, and a large body of ready-touse, high-quality code your application can inherit.

MacApp2.0allowsprogrammerstouse C++inplaceofObjectPascalfortheirown applications. This is accomplished through the use of special C++interface files, because MPW C++cancallObjectPascal-basedprocedures and functions.

Formoreinformation on MacApp, refer totheMacAppdatasheet(ordernumber M0243LL/A)orcontactAPDA.

Training and Support Apple has been offering courses in C++ programmingsincelate 1989. For details, pleasecontact
