

If you have Microsoft Word for the Macintosh, you can open this document without requiring any translation. Notice that the formatting has been kept intact:

This is a centered paragraph. All of the text in this paragraph is centered within the paragraph margins.

**Boldface**, *italic*, ~~strikethrough~~, underline, even <sub>sub</sub>script and <sup>super</sup>script text.

Now you can use your MS-Word files directly on MS-DOS disks!

Note that MacWrite II, with its XTND technology, can automatically recognize and convert MS-Word/PC files, too.

AccessPC is the natural complement to XTND-based Macintosh applications; XTND can read PC files, AccessPC lets your Mac use the PC disks that these files are on.
