# SuperTCP Suite Installation Options

SuperTCP Suite provides a step by step installation which will allow you to choose the type of networking environment that fits your needs.   You will need to have some essential networking information to proceed with the installation such as your IP Address or Type, your IP Mask, etc.   This information can obtained from your System Administrator or Internet Service Provider.

# Custom Installation

This option displays if you already have software from Frontier Technologies Corporation installed on your computer.   Click the Custom Install button to procede with changing your options.

# On The Road

If you choose the On-the-Road option, configure your dial up environment and then your LAN environment.   The installation procedure will then set up your interfaces with a switch to go between them.

# Winsock Detected

If SuperTCP Suite detects another WINSOCK.DLL on your system, you have two options.

Frontier recommends you choose to install our VxD WINSOCK.DLL.   Your old WINSOCK.DLL will be renamed to WINSOCK.OEM.

You can also choose to run SuperTCP Suite applications over your old WINSOCK.DLL. SuperTCP Suite applications are Winsock 1.1 compliant and will run over other compliant stacks.   You will not be able to use the NFS or PPP modules.
