Join the Internet Community with PC-NFS Software

This is a brief guide to using the PC-NFS software to access information, use services, and communicate with other people and companies using the Internet. The Internet is a network of interconnected computer networks, all tied together by the use of the TCP/IP communications protocol. These networks span the globe, and represent corporations, governments, universities and individuals. See the Resources section for a list of introductory books and on-line guides to the Internet.

Getting Connected

Before you can use the Internet, you must have an Internet connection. There are many ways in which your PC may be connected to the Internet. One of the most common in office settings is using a server on your local LAN as an Internet *gateway* to an Internet Service Provider.

Ask your network administrator if your LAN has an Internet *gateway*. If you are a network administrator trying to set up such a *gateway*,

you will need to contact the sales representative for your server to get the necessary software, and one of the Internet Service Providers listed at the end of this document to get a connection.

If the *gateway* you are using has a security *fire-wall* between your PC and the Internet, you may be unable to use some or all of the features described below. Consult the administrator of the Internet *gateway* server for more information on the particular restrictions on your LAN.

Setting Up PC-NFS Software for Internet Access

However you connect your PC to the Internet, it will be easiest if you configure the PC-NFS software to use Domain Name Service (DNS) for name resolution. If you choose NIS or File for name resolution, you will have to manually enter the numerical IP address for any Internet servers you want to use. Using DNS will instead allow you to specify the name of the server.

See the PC-NFS Installation and Configuration Guide for instructions on configuring DNS.

Retrieving Information and Software

Many companies, government agencies, educational institutions and non-profit organizations make information and software available via the Internet. The most common way of retrieving this information and software is with the PC-NFS FTP utility. To use it, you will need to know the name of the Internet server and the name of the file you are retrieving. The Resources section of this guide provides a list of some of the most useful software and information available, including several introductory guides to the Internet. The PC-NFS User's Guide contains complete information on how to retrieve files using the PC-NFS FTP utility. When retrieving software or information from an Internet server, use the username 'anonymous' and enter your name or email address as the password to gain access to the server.

Accessing Services

Another common use of the Internet is to access services. Some of these require you to first open an account with the service provider, and others offer services to anyone who wants to use them. The PC-NFS User's Guide contains complete information on using the PC-NFS Telnet utility to connect to servers.

Many of the services available on the Internet are listed in the books and on-line guides in the Resources section.

Communicating with Other People and Organizations

Most people on the Internet use electronic mail, or email, to communicate with each other. The PC-NFS add-on product, SelectMail, provides an easy way to send and receive mail on the

Internet.

Resources

The on-line resources listed here are all available via the PC-NFS FTP utility. If you cannot find files listed here, the names may have changed or the files moved.

The product information in this guide was derived from public sources. Sun Microsystems, Inc. has not qualified or reviewed any of such information, including any claims made about product features or functions and is not responsible for the accuracy of this information. The names of publicly available servers and files and their availability were accurate when this guide was published, but may be changed at any time by the owners of those resources.
