Freelance Graphics: Activate method

{button ,AL(`;H_DOCUMENT_CLASS;H_OLEOBJECT_CLASS;H_PLACEMENTBLOCK_CLASS;',0)} See list of classes

Simulate a click action on a document, a "Click here..." block, or an OLE object. (Activate for an OLE object is only available in Freelance Graphics 97.) The object becomes the current object and is brought to the foreground.

Syntax

DocumentObject.Activate

or

PlacementBlockObject.Activate

or

OLEObject.Activate

Parameters

None

Return values

None

Usage

When used on an instance of the Document class, the Activate method brings the document to the front. When used on an instance of the PlacementBlock class, the Activate method simulates a click on a "Click here..." block. When used on an instance of the OLEObject class, the Activate method launches the server associated with the embedded object.

Examples

```
CurrentApplication.Documents(2).Activate
```

or [TextPlacementBlock1].Activate or Set MyOLE = CurrentPage.CreateObject "PaintBrush Picture" MyOLE.Activate

Freelance Graphics: AddPoint method

{button ,AL(`H_ADDPOINT_METHOD_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> Add a point to the object.

Syntax

drawobject.AddPoint(segment, x, y)

Parameters

segment as Integer

Identifies the point after which you want to add the new point. (The first drawn point is 1.) If the object in question is not a polygon, line, arrow, or curve, this value is ignored.

x as Integer

Horizontal coordinate of the point relative to the left edge of the window, in twips.

y as Integer

Vertical coordinate of the point relative to the bottom of the window, in twips.

Return values

Freelance Graphics: AddToPageSelection method

{button ,AL(`H_ADDTOPAGESELECTION_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} See list of classes Add a page to the set of selected pages in the document.

Syntax

documentobject.AddToPageSelection(pageobject)

Parameters

pageobject as Page

Any page object.

Return values None

Examples

CurrentDocument.AddToPageSelection MyPage

Freelance Graphics: AddToSelection method

{button ,AL(`H_ADDTOSELECTION_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;H_PAGESELECTION_CLAS S;H_SELECTION_CLASS;',0)} See list of classes

Add the specified object to the set of selected documents, pages, or objects.

Syntax

object.AddToSelection(drawobject)

Parameters

drawobject as DrawObject Any DrawObject object.

Return values

None

Examples

CurrentPage.Selection.AddToSelection MyRect

or

Selection.AddToSelection MyRect

Freelance Graphics: Align method {button ,AL(`H_ALIGN_METHOD_MEMDEF_RT;H_SELECTION_CLASS;',0)} <u>See list of classes</u> Align the currently selected objects.

Syntax

selectionobject.Align(aligntype, centeronpage)

Parameters

aligntype as Variant (Enumerated)

	Value	Description
	\$AlignLeft	Align left sides
	\$AlignRight	Align right sides
	\$AlignTop	Align tops
	\$AlignBottor	m Align bottoms
	\$AlignRow	Center in a row
	\$AlignColun	nn Center in a column
	\$AlignPoint	Center on a point
centeronpage as Integer (Boolean)		
	Value	Description
	TRUE (-1)	Center on page
	FALSE (0)	Do not center on page

Return values

None

Examples

Selection.Align \$AlignLeft, False

Freelance Graphics: ApplyStyle method {button ,AL(`H_APPLYSTYLE_METHOD_MEMDEF_RT;H_TEXTPROPERTIES_CLASS;',0)} See list of classes Apply the specified style name to the text block.

Syntax

textblockobject.ApplyStyle(stylename)

Parameters

stylename as String

Name to apply to the style.

Return values

Freelance Graphics: BrowseDiagrams method

{button ,AL(`H_BROWSEDIAGRAMS_METHOD_MEMDEF_RT;H_PLACEMENTBLOCK_CLASS;',0)} See list of classes

Launch the Clip Art browser using the specified diagram file. When the user clicks OK in the browser, insert the currently selected diagram in the "Click here..." block.

Syntax

placementblockobject.BrowseDiagrams(filename)

Parameters

filename as String

Optional name of the diagram file. If omitted, defaults to the first .DGM file in the \SMASTERS\FLG directory.

Return values

Freelance Graphics: BrowseSymbols method

{button ,AL(`H_BROWSESYMBOLS_METHOD_MEMDEF_RT;H_PLACEMENTBLOCK_CLASS;',0)} See list of classes

Launch the Clip Art browser using the specified symbol file. When the user clicks OK in the browser, insert the currently selected symbol in the "Click here..." block.

Syntax

placementblockobject.BrowseSymbols(filename)

Parameters

filename as String

Optional name of the symbols file. If omitted, defaults to the first .SYM file in the \SMASTERS\FLG directory.

Return values

Freelance Graphics: Cascade method

{button ,AL(`H_CASCADE_METHOD_MEMDEF_RT;H_APPLICATIONWINDOW_CLASS;H_DOCWINDOW_CLASS;' ,0)} See list of classes

Cascades all document windows within the Freelance Graphics application window.

Syntax

applicationwindowobject.Cascade

Parameters

None

Return values None

Examples

CurrentApplication.Cascade

Freelance Graphics: ClearSelection method {button ,AL(`H_CLEARSELECTION_METHOD_MEMDEF_RT;H_PAGESELECTION_CLASS;H_SELECTION_CLAS S;',0)} <u>See list of classes</u>

Deselect all selected items.

Syntax object.ClearSelection

Parameters

None

Return values None

Examples Selection.ClearSelection

Freelance Graphics: CloseWindow method

{button ,AL(`H_CLOSEWINDOW_METHOD_MEMDEF_RT;H_APPLICATION_CLASS;',0)} <u>See list of classes</u> Closes the Freelance Graphics application.

Syntax

applicationobject.CloseWindow(closewindow)

Parameters

closewindow as Integer Optional and ignored.

Return values

None

Status codes

None

Examples

CurrentDocument.Save CurrentDocument.CloseWindow

Freelance Graphics: Close method

{button ,AL(`H_CLOSE_METHOD_MEMDEF_RT;H_APPLICATIONWINDOW_CLASS;H_DOCUMENT_CLASS;H_D OCWINDOW_CLASS;',0)} See list of classes

Close the Freelance Graphics application window (exit Freelance Graphics), or close a document or document window.

Syntax

documentobject.Close(savechanges, docname, location)

or

appwindowbject.Close

or

docwindowobject.Close(exitapplication)

Parameters

savechanges As Integer

Optional. If True (non-zero), changes are always saved. If False (zero), changes are never saved. If omitted, the user is consulted if the file has been changed.

docname As String

Optional. Document name.

location As String

Optional. Path.

exitapplication As Integer

Optional. If False (zero), saves the document (if this is the first time the file is saved, opens the SaveAs dialog box, so user can enter a file name). If True (non-zero) or omitted, file closes without saving the document.

Return values

None

Usage

The Close method works slightly differently for each of the classes where it is available.

In the Document.Close case: If the first parameter, *savechanges*, is omitted, the user is consulted if the file is changed. If *savechanges* is True, the file is saved. If *savechanges* is False, the file is closed without being saved. In the ApplicationWindow.Close case: The application simply closes, parameters are ignored. Nothing is saved. In the DocWindow.Close case: There is only one parameter in this case. If the parameter, *exitapplication*, is False (zero), the file is saved. If the parameter, *exitapplication*, is True or omitted, the file is closed without being saved.

Examples

CurrentApplication.Close

Freelance Graphics: ColorToRGB method

{button ,AL(`H_COLORTORGB_METHOD_MEMDEF_RT;H_COLORS_CLASS;',0)} See list of classes Return the <u>RGB value</u> of the color produced by the current values of the Red, Green, and Blue properties of a Color object.

Syntax

colorsobject.ColorToRGB(colorobject)

Parameters

colorobject as Color

The Color object whose RGB value you want returned.

Return values

Long, RGB value.

Examples

Dim MyColorRGB as Long
MyColorRGB = CurrentApplication.Colors.ColorToRGB(MyColor)

Freelance Graphics: Connect method {button ,AL(`H_CONNECT_METHOD_MEMDEF_RT;H_SELECTION_CLASS;',0)} See list of classes Connect the currently selected line objects.

Syntax selection.Connect

Parameters None

Return values None

Example Selection.Connect

Freelance Graphics: ConvertTo method

{button ,AL(`H_CONVERTTO_METHOD_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} See list of classes Convert the object to lines or polygons.

Syntax

drawobject.ConvertTo(conversiontype)

Parameters

conversiontype as Integer (Enumerated)

Value	Description
\$ConvertToPolygons	Create one or more polygons from the object
\$ConvertToLines	Create one or more lines from the object

Return values

None

Examples

Dim MyRect as DrawObject
Set MyRect = CurrentPage.CreateRect
MyRect.ConvertTo(\$ConvertToLines)

Freelance Graphics: CopyPage method {button ,AL(`H_COPYPAGE_METHOD_MEMDEF_RT;H_PAGE_CLASS;',0)} See list of classes Copy a page to the Clipboard.

Syntax pageobject.CopyPage

Parameters None

Return values None

Examples CurrentPage.CopyPage

Freelance Graphics: CopySelection method {button ,AL(`H_COPYSELECTION_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} See list of classes Copy the selection to the Clipboard.

Syntax documentobject.CopySelection

Parameters None

Return values None

Examples CurrentPage.CopySelection

Freelance Graphics: Copy method {button ,AL(`H_COPY_METHOD_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> Copy an object to the Clipboard.

Syntax

drawobject.Copy

Parameters

None

Return values

None

Examples

CurrentSelection.Copy

or

Dim MyRect as DrawObject Set MyRect = CurrentPage.CreateRect MyRect.Copy

Freelance Graphics: CreateArrow method

{button ,AL(`H_CREATEARROW_METHOD_MEMDEF_RT;H_PAGE_CLASS;',0)} See list of classes Draw an arrow on the page.

Syntax

pageobject.CreateArrow(xstart, ystart, xfinish, yfinish)

Parameters

xstart as Integer

(Optional, see note) Starting horizontal coordinate of the arrow, in twips.

ystart as Integer

(Optional, see note) Starting vertical coordinate of the arrow, in twips.

xfinish as Integer

(Optional, see note) Ending horizontal coordinate of the arrow, in twips.

yfinish as Integer

(Optional, see note) Ending vertical coordinate of the arrow, in twips.

Note If you omit the parameters, the arrow will be centered on the page.

Return values

An instance of the DrawObject class (the drawn arrow).

Examples

```
Dim MyArrow as DrawObject
Set MyArrow = CurrentPage.CreateArrow(1000, 1000, 3000, 3000)
```

Freelance Graphics: CreateChart method

{button ,AL(`H_CREATECHART_METHOD_MEMDEF_RT;H_PAGE_CLASS;',0)} See list of classes Create a chart on the page.

Note For more information on working with charts in LotusScript, search for ChartBase in the Help Index.

Syntax

pageobject.CreateChart(x, y, width, height)

Parameters

x as Integer

(Optional, see note) Right edge of the chart object relative to the left edge of the window, in twips.

y as Integer

(Optional, see note) Bottom edge of the chart object relative to the bottom of the window, in twips.

width as Integer

(Optional, see note) Width in twips.

height as Integer

(Optional, see note) Height in twips. **Note** If you omit the parameters, the chart will be centered on the page.

Return values

An instance of the DrawObject class (the drawn chart).

Examples

```
Dim MyChart as Chart
Set MyChart = CurrentPage.CreateChart(4000,10000,6000,6000)
```

Freelance Graphics: CreateComment method

{button ,AL(`H_CREATECOMMENT_METHOD_MEMDEF_RT;H_PAGE_CLASS;',0)} <u>See list of classes</u> Create TeamReview comments on a page.

Syntax

pageobject.CreateComment(x, y, width, height)

Parameters

x as Integer

(Optional, see note) Right edge of the comment object relative to the left edge of the window, in twips.

y as Integer

(Optional, see note) Bottom edge of the comment object relative to the bottom of the window, in twips.

width as Integer

(Optional, see note) Width in twips.

height as Integer

(Optional, see note) Height in twips.

Note If you omit the parameters, the comment will be centered on the page.

Return values

An instance of the DrawObject class (the TeamReview comments).

Examples

CurrentPage.CreateComment "Four score and seven years ago"

Freelance Graphics: CreateLine method

{button ,AL(`H_CREATELINE_METHOD_MEMDEF_RT;H_PAGE_CLASS;',0)} See list of classes Draw a line on the page.

Syntax

pageobject.CreateLine(xstart, ystart, xfinish, yfinish)

Parameters

xstart as Integer

(Optional, see note) Starting horizontal coordinate of the line, in twips.

ystart as Integer

(Optional, see note) Starting vertical coordinate of the line, in twips.

xfinish as Integer

(Optional, see note) Ending horizontal coordinate of the line, in twips.

yfinish as Integer

(Optional, see note) Ending vertical coordinate of the line, in twips.

Note If you omit the parameters, the line will be centered on the page.

Return values

An instance of the DrawObject class (the drawn line).

Example

```
Dim MyLine as DrawObject
Set MyLine = CurrentPage.CreateLine(1000, 1000, 3000, 3000)
```

Freelance Graphics: CreateMovie method

{button ,AL(`H_CREATEMOVIE_METHOD_MEMDEF_RT;H_PAGE_CLASS;',0)} See list of classes Add a movie to the page.

Syntax

pageobject.CreateMovie(x, y, width, height, filename)

Parameters

x as Integer

(Optional, see note) Left edge of the movie window relative to the left edge of the window, in twips.

y as Integer

(Optional, see note) Bottom edge of the movie window relative to the bottom of the window, in twips.

width as Integer

(Optional, see note) Width in twips.

height as Integer

(Optional, see note) Height in twips.

filename as String

Name of the file containing the movie to be added to the page.

Note If you omit the optional parameters, the movie will be located in a default position defined by the product.

Return values

An instance of the DrawObject class (the movie object).

Freelance Graphics: CreateObject method

{button ,AL(`;H_PAGE_CLASS',0)} See list of classes

Available only in Freelance Graphics 97.

Controls the creation of an OLE object. The OLE object is an instance of the DrawObject class.

Syntax

PageObject.**CreateObject**(Class type As String|Filename As String, Link As Intger, DisplayIcon As Integer, x As Integer, y As Integer, w As Integer, h As Integer)

Parameters

ClassType As String

Optional only if the second parameter is present, otherwise this parameter is manditory. Input parameter. The type of object that you want to embed in a presentation. The list of object types includes a Bitmap Image, Paintbrush Picture, and so on. In Freelance Graphics choose Create - Object to see the list of objects available to you. The list is dependent on those OLE applications that you have on your system. Use the program name as it appears in the Windows registry or you can use the progrid from the registry.

FileName As String

Optional only if the first parameter is present, otherwise this parameter is manditory. Input parameter. If creating the object from a file, use this parameter to show path and name of the file.

Link As Integer

Optional. Input. True (link) or false (embed), where false is zero, and true is any non-zero integer.

DisplayAslcon As Integer

Optional. Input. True (displayed as an icon) or false (displayed as a metafile representation). Where false is zero, and true is any positive integer.

x As Integer

(Optional, see note) Input. Horizontal <u>coordinate</u> measured in <u>twips</u>. The default value results in an object roughly centered on the page.

y As Integer

(Optional, see note) Input. Vertical <u>coordinate</u> measured in <u>twips</u>. The default value results in an object roughly centered on the page.

w As Integer

(Optional, see note) Input. Width of area taken up by the OLE object measured in twips. The default value results in an object roughly centered on the page.

h As Integer

(Optional, see note) Input. Height of the area taken up by the OLE object measured in twips. The default value results in an object roughly centered on the page.

Note If you omit the parameters, the object will be centered on the page.

Return values

Returns a OLEObject class reference.

Usage

Either the first or second parameter must be present.

Example

' In this example, you create an instance of an OLE object (a Paintbrush picture). Set MyOLE = CurrentPage.CreateObject ("PaintBrush Picture")

Freelance Graphics: CreateOval method

{button ,AL(`H_CREATEOVAL_METHOD_MEMDEF_RT;H_PAGE_CLASS;',0)} See list of classes Draw an oval on the page.

Syntax

pageobject.CreateOval(xcenter, ycenter, width, height)

Parameters

xcenter as Integer

(Optional, see note) Horizontal coordinate starting at the top-left "corner" of the oval, in twips.

ycenter as Integer

(Optional, see note) Vertical coordinate starting at the top-left "corner" of the oval, in twips.

width as Integer

(Optional, see note) Width of the oval, in twips.

height as Integer

(Optional, see note) Height of the oval, in twips.

Note If you omit the parameters, the oval will be centered on the page.

Return values

An instance of the DrawObject class (the drawn oval).

Examples

```
Dim MyOval as DrawObject
Set MyOval = CurrentPage.CreateOval(1000, 1000, 3000, 3000)
```

Freelance Graphics: CreatePageFromTemplate method

{button ,AL(`H_CREATEPAGEFROMTEMPLATE_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} <u>See list of</u> <u>classes</u>

Create a new page using a content topic.

Syntax

document.CreatePageFromTemplate pagetitle, templateindex

Parameters

PageTitle as String

Name for the new page.

TemplateIndex as Integer

Identifies the content topic page type (the first type is 1).

Return values

An instance of the Page class.

Freelance Graphics: CreatePage method

{button ,AL(`H_CREATEPAGE_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} See list of classes Create a new page.

Syntax

documentobject.CreatePage pagetitle, masterindex

Parameters

pagetitle as String

Name for the new page

masterindex as Integer

Identifies the SmartLook to be used (1--refers to the first one in the list of SmartLooks that are on your system; 2--refers to the second, and so on). To see the list of SmartLooks: in the main menu, choose Presentation - Choose a Different SmartMaster Look.

Return values

An instance of the Page class.

Examples

Dim Page1 as Page
Set Page1 = CurrentDocument.CreatePage("My Title Page",1)

Freelance Graphics: CreatePlacementBlock method

{button ,AL(`H_CREATEPLACEMENTBLOCK_METHOD_MEMDEF_RT;H_PAGE_CLASS;',0)} See list of classes Create a "Click here..." block.

Syntax

pageobject.CreatePlacementBlock(x, y, width, height, blocktype, text)

Parameters

x as Integer

(Optional, see note) Left edge of the object relative to the left edge of the window, in twips.

y as Integer

(Optional, see note) Bottom edge of the object relative to the bottom of the window, in twips.

width as Integer

(Optional, see note) Width in twips.

height as Integer

(Optional, see note) Height in twips.

blocktype as Variant

Value	Description
pbTypeText	Click here to enter text
pbTypeSymbol	Click here to add a symbol
pbTypeChart	Click here to create a chart
pbTypeOrgChart	Click here to create an organization chart
pbTypeTable	Click here to create a table
pbTypeButton	Click here to add a button

text as String

Prompt text to include in the "Click here..." box.

Note If you omit the optional parameters, the block will be centered on the page.

Return values

An instance of the DrawObject class.

Freelance Graphics: CreateRect method

{button ,AL(`H_CREATERECT_METHOD_MEMDEF_RT;H_PAGE_CLASS;',0)} See list of classes Draw a rectangle on the page.

Syntax

pageobject.CreateRect(xcenter, ycenter, width, height)

Parameters

xcenter as Integer

(Optional, see note) Horizontal coordinate starting at the top-left corner of the rectangle, in twips.

ycenter as Integer

(Optional, see note) Vertical coordinate starting at the top-left corner of the rectangle, in twips.

width as Integer

(Optional, see note) Width of the rectangle, in twips.

height as Integer

(Optional, see note) Height of the rectangle, in twips.

Note If you omit the parameters, the rectangle will be centered on the page.

Return values

An instance of the DrawObject class (the drawn rectangle).

Examples

```
Dim MyRect as DrawObject
Set MyRect = CurrentPage.CreateRect(1000, 1000, 2000, 2000)
```

Freelance Graphics: CreateStyle method {button ,AL(`H_CREATESTYLE_METHOD_MEMDEF_RT;H_TEXTBLOCK_CLASS;',0)} See list of classes Create a new named style based on the attributes of the text block.

Syntax

textblockobject.CreateStyle(stylename)

Parameters

stylename as String Name of the new style.

Return values

Freelance Graphics: CreateSymbol method

{button ,AL(`H_CREATESYMBOL_METHOD_MEMDEF_RT;H_PAGE_CLASS;',0)} <u>See list of classes</u> Add a symbol to the page.

Syntax

pageobject.CreateSymbol(filename, index, x, y, width, height)

Parameters

filename as String

Name of the file containing the symbol.

index as Integer

Sequence number of the symbol in the file.

x as Integer

(Optional, see note) Left edge of the symbol relative to the left edge of the window, in twips.

y as Integer

(Optional, see note) Bottom edge of the symbol relative to the bottom of the window, in twips.

width as Integer

(Optional, see note) Width in twips.

height as Integer

(Optional, see note) Height in twips.

Note If you omit the optional parameters, the symbol will be centered on the page.

Return values

An instance of the DrawObject class (the symbol object).

Freelance Graphics: CreateTable method

{button ,AL(`H_CREATETABLE_METHOD_MEMDEF_RT;H_PAGE_CLASS;',0)} See list of classes Create a table on the page.

Syntax

pageobject.CreateTable(type, rows, columns, x, y, width, height)

Parameters

type as Integer

See the Create Table dialog's Table Gallery for examples of the following grid types.

Value Description

- 1 Full grid
- 2 Grid except for first row and column
- 3 Outline around outside of table
- 4 No grid lines

rows as Integer

Number of rows.

columns as Integer

Number of columns.

x as Integer

(Optional, see note) Left edge of the table relative to the left edge of the window, in twips.

y as Integer

(Optional, see note) Bottom edge of the table relative to the bottom of the window, in twips.

width as Integer

(Optional, see note) Width in twips.

height as Integer

(Optional, see note) Height in twips.

Note If you omit the optional parameters, the table will be centered on the page.

Return values

An instance of the Table class.

Freelance Graphics: CreateText method

{button ,AL(`H_CREATETEXT_METHOD_MEMDEF_RT;H_PAGE_CLASS;',0)} See list of classes Create a text block.

Syntax

pageobject.CreateText(x, y, width, height)

Parameters

x as Integer

(Optional, see note) Left edge of the text block relative to the left edge of the window, in twips.

y as Integer

(Optional, see note) Top edge of the text block relative to the bottom of the window, in twips.

width as Integer

(Optional, see note) Width in twips.

height as Integer

(Optional, see note) Height in twips.

Note If you omit the parameters, the text will be centered on the page.

Return values

An instance of the DrawObject class.

Freelance Graphics: CutPage method {button ,AL(`H_CUTPAGE_METHOD_MEMDEF_RT;H_PAGE_CLASS;',0)} <u>See list of classes</u> Cut a Page object and place it on the Clipboard.

Syntax pageobject.CutPage

Parameters None

Return values None

Examples CurrentPage.CutPage

Freelance Graphics: CutSelection method {button ,AL(`H_CUTSELECTION_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} <u>See list of classes</u> Cut the current selection and place it on the Clipboard.

Syntax

documentobject.CutSelection

Parameters

None

Return values None

Examples CurrentSelection.CutSelection

Freelance Graphics: Cut method

{button ,AL(`H_CUT_METHOD_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} See list of classes Cut a DrawObject and place it on the Clipboard.

Syntax

drawobject.Cut

Parameters

None

Return values None

Examples

Dim MyRect as DrawObject Set MyRect = CurrentPage.CreateRect() MyRect.Cut
Freelance Graphics: DeleteCol method {button ,AL(`H_DELETECOL_METHOD_MEMDEF_RT;H_TABLE_CLASS;',0)} <u>See list of classes</u> Delete a specified column from the table.

Syntax

tableobject.DeleteCol(column)

Parameters

column as Integer Number of the column to delete.

Return values

Freelance Graphics: DeletePage method {button ,AL(`H_DELETEPAGE_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} <u>See list of classes</u> Delete the specified page.

Syntax

documentobject.DeletePage(pageobject)

Parameters

pageobject as Page

The page to delete.

Return values

Freelance Graphics: DeleteReviewer method {button ,AL(`H_DELETEREVIEWER_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} <u>See list of classes</u> Open the dialog box used to delete a TeamReview reviewer.

Syntax

documentobject.DeleteReviewer

Parameters None

Return values None

Freelance Graphics: DeleteRow method {button ,AL(`H_DELETEROW_METHOD_MEMDEF_RT;H_TABLE_CLASS;',0)} See list of classes Delete a specified row from the table.

Syntax

tableobject.DeleteRow(row)

Parameters

row as Integer

The number of the row to delete.

Return values

Freelance Graphics: DeleteSpeakerNote method {button ,AL(`H_DELETESPEAKERNOTE_METHOD_MEMDEF_RT;H_PAGE_CLASS;',0)} <u>See list of classes</u> Delete speaker notes from the page.

Syntax pageobject.DeleteSpeakerNote

Parameters None

Return values None

Examples CurrentPage.DeleteSpeakerNote

Freelance Graphics: Deselect method {button ,AL(`;H_DOCUMENT_CLASS',0)} See list of classes Clear all the selected objects on the current page.

Syntax

documentobject.Deselect

Return values

None

Example

CurrentDocument.Deselect

Freelance Graphics: DistributeForComment method {button ,AL(`H_DISTRIBUTEFORCOMMENT_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} <u>See list of</u> classes

Open the Distribute for Comment dialog box.

Syntax

documentobject.DistributeForComment

Parameters

None

Return values

Freelance Graphics DoVerb method

{button ,AL(`;H_OLEOBJECT_CLASS',0)} See list of classes

Available only in Freelance Graphics 97.

DoVerb is a variant.

Syntax

OLEObject.**DoVerb**(Index)

Parameters

Index As Integer

Indicates which action to take. Starts with zero. Indicates whatever action is available for this instance of the OLEObject. For example, a Freelance Graphics presentation OLE object has the actions: Edit presentation, Run Screen Show, and Convert. These actions correspond to the index values of 0, 1, and 2, respectively.

Return values

None.

Usage

You use this method to perform actions on an instance of the OLEObject.

Example

' In this example, you create an instance of an OLE object

' (a Paintbrush picture), and then using the reference, MyOLE, you

' use the DoVerb method to act on the created object.

Set MyOLE = CurrentPage.CreateObject ("PaintBrush Picture")
EDITPICT = 0
MyOLE.DoVerb EDITPICT

Freelance Graphics: EnterEditMode {button ,AL(`H_ENTEREDITMODE_METHOD_MEMDEF_RT;H_TEXTBLOCK_CLASS;',0)} <u>See list of classes</u> Enter edit mode on a text block.

Syntax

textblockobject.EnterEditMode

Parameters

None

Return values None

Freelance Graphics: FindNextObject method

{button ,AL(`H_FINDNEXTOBJECT_METHOD_MEMDEF_RT;H_PAGE_CLASS;',0)} <u>See list of classes</u> Find the next occurrence of the specified named object on the Page. **Note** Use FindObject to find the first occurrence of an object on a Page.

Syntax

pageobject.FindNextObject(objectname, afterme)

Parameters

objectname as String

Name of the object to find.

afterme as DrawObject

(Optional) The object after which to begin the search.

Return values

An instance of the DrawObject class (the found object).

Examples

```
Dim Rect2 as DrawObject
Set Rect2 = CurrentPage.FindNextObject("MyRect")
```

Freelance Graphics: FindObject method

{button ,AL(`H_FINDOBJECT_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;H_PAGE_CLASS;',0)} <u>See list of</u> <u>classes</u>

Find the first occurrence of the specified named object in the Document or on the Page.

Note Use FindNextObject to find subsequent occurrences of an object on a Page.

Syntax

object.FindObject(objectname)

Parameters

objectname as String Name of the object to find.

Return values

An instance of the DrawObject class.

Examples

```
Dim Rect1 as DrawObject
Set Rect1 = CurrentPage.FindObject("My Rect")
```

Freelance Graphics: Flip method {button ,AL(`H_FLIP_METHOD_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} See list of classes Flip the object top-to-bottom or left-to-right.

Syntax

drawobject.Flip(flipdirection)

Parameters

flipdirection as Variant (Enumerated)

Value	Description
\$FlipLeftToRight	Mirror the image on the vertical plane
\$FlipTopToBottom	Mirror the image on the horizontal plane

Return values

None

Examples

CurrentSelection.Flip(\$FlipLeftToRight)

Freelance Graphics: GetBulletCount method {button ,AL(`H_GETBULLETCOUNT_METHOD_MEMDEF_RT;H_TEXTBLOCK_CLASS;',0)} <u>See list of classes</u> Return the number of bulleted items in the text block.

Syntax

textblock.GetBulletCount

Parameters

None

Return values

Number of bullets (Integer)

Freelance Graphics: GetCell method

{button ,AL(`H_GETCELL_METHOD_MEMDEF_RT;H_TABLE_CLASS;',0)} <u>See list of classes</u> Return the specified cell as a drawn object.

Syntax

tableobject.GetCell(row, column)

Parameters

row as Integer

Row number of the row containing the text.

column as Integer

Column number of the column containing the text.

Return values

An instance of the TextBlock class.

Freelance Graphics: GetEnum method

{button ,AL(`H_GETENUM_METHOD_MEMDEF_RT;H_APPLICATION_CLASS;',0)} <u>See list of classes</u> Resolve the specified enumerated type to its value. This is useful for cross-application scripts.

Syntax

applicationobject.GetEnum(enumerationname)

Parameters

enumerationname as Variant

An enumeration name as a string, with or without the \$.

Return values

Value of the specified enumeration name.

Example

CurrentApplication.GetEnum("ViewDraw")

Freelance Graphics: GetIndex method

{button ,AL(`H_GETINDEX_METHOD_MEMDEF_RT;H_COLORS_CLASS;H_DOCUMENTS_CLASS;H_OBJECTS_ CLASS;H_PAGES_CLASS;',0)} See list of classes

Returns the index (e.g., the fifth object in the set).

Syntax

objectset.GetIndex(object, startingindex)

Parameters

object as object

The instance of the object whose index you want.

startingindex as Integer

Optional starting position in the set for the search.

Return values

Integer indicating the object occurrence within the set of objects (for example, the page number of a specified page within the set of pages).

Example

```
Dim ThisIndex as Integer
ThisIndex = CurrentPage.Objects.GetIndex(MyRect)
```

or

```
Dim ThisIndex as Index
ThisIndex = CurrentApplication.Colors.GetIndex(MyColor)
```

Freelance Graphics: GetMarkup method

{button ,AL(`H_GETMARKUP_METHOD_MEMDEF_RT;H_TEXTBLOCK_CLASS;',0)} <u>See list of classes</u> Return the text and all markup attributes from a TextBlock, as a string.

Syntax

textblockobject.GetMarkup

Parameters

None

Return values

A string containing the text from a TextBlock object, and all markup attributes for that text.

Freelance Graphics: GetNearestColor method

{button ,AL(`H_GETNEARESTCOLOR_METHOD_MEMDEF_RT;H_COLORS_CLASS;',0)} <u>See list of classes</u> Return the closest available color (in the Freelance Color Library) to the color specified.

Syntax

colorsobject.GetNearestColor(colorobject)

Parameters

colorobject as Color

The Color object whose color you want to match as closely as possible.

Return values

An object of the Color class that is the closest match to the passed color.

Example

```
Dim MyLibraryColor as Color
Dim MyColor as Color
Set MyColor = CurrentApplication.Colors.RGBToColor(17395023)
Set MyLibraryColor = CurrentApplication.Colors.GetNearestColor(MyColor)
```

Freelance Graphics: GetNearestIndex method

{button ,AL(`H_GETNEARESTINDEX_METHOD_MEMDEF_RT;H_COLOR_CLASS;',0)} See list of classes Return the index of the closest available color for the color specified.

Syntax

colorobject.GetNearestIndex(colorobject)

Parameters

colorobject as Color

The Color object whose color you want to match as closely as possible.

Return values

An integer containing the index of the Color class that is the closest match to the passed color.

Freelance Graphics: GetNthBullet method

{button ,AL(`H_GETNTHBULLET_METHOD_MEMDEF_RT;H_TEXTBLOCK_CLASS;',0)} <u>See list of classes</u> Return the text from the nth bulleted item within the text block.

Syntax

textblockobject.GetNthBullet(n)

Parameters

n as Integer

Sequence number of the bullet.

Return values

A string containing the text from the nth bulleted item.

Freelance Graphics: GetObjectData method

{button ,AL(`H_GETOBJECTDATA_METHOD_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> Return user-defined object data (persistent, string-valued name and value pair).

Syntax

drawobject.GetObjectData(variablename)

Parameters

variablename as String Name of a user-defined variable.

Return values

String containing the value of the named variable.

Freelance Graphics: GetRGB method

{button ,AL(`H_GETRGB_METHOD_MEMDEF_RT;H_COLOR_CLASS;',0)} <u>See list of classes</u> Return the <u>RGB value</u> of the color produced by the current values of the Red, Green, and Blue properties of a Color object.

Syntax

colorobject.GetRGB

Parameters

None

Return values Long, RGB value.

Examples

Dim RGBValue as Long RGBValue = MyColor.GetRGB()

Freelance Graphics: GetSelection method

{button ,AL(`H_GETSELECTION_METHOD_MEMDEF_RT;H_PAGESELECTION_CLASS;H_SELECTION_CLASS;',
0)} See list of classes

Returns the specified selected object from the set of currently selected objects.

Syntax

objectselection.GetSelection(objectnumber)

Parameters

objectnumber as Integer The number of the object or page to be returned.

Return values

The DrawObject at the specified index in the selection.

Examples

'with at least two draw objects selected: Dim Rect2 as DrawObject Set Rect2 = Selection.GetSelection(2)

Freelance Graphics: GetSpeakerNoteMarkup method

{button ,AL(`H_GETSPEAKERNOTEMARKUP_METHOD_MEMDEF_RT;H_PAGE_CLASS;',0)} <u>See list of classes</u> Return the text from the speaker notes from a page, including all markups.

Syntax

pageobject.GetSpeakerNoteMarkup

Parameters

None

Return values

A string containing the text from the speaker notes for a page, and all markup attributes for that text.

Freelance Graphics: GotoNotes method

{button ,AL(`H_GOTONOTES_METHOD_MEMDEF_RT;H_APPLICATIONWINDOW_CLASS;',0)} <u>See list of classes</u> Switch window focus to Lotus Notes. (If Notes is not running, it will be launched.)

Syntax

applicationwindow.GotoNotes

Parameters None

Return values None

Freelance Graphics: GotoPage method

{button ,AL(`H_GOTOPAGE_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} <u>See list of classes</u> Go to the page specified by a page number, page name, or object name.

Syntax

documentobject.GotoPage pageindicator

Parameters

pageindicator as Variant

Page number (integer), page name (string), or Page object.

Return values

None

Examples

CurrentDocument.GotoPage(5)

Freelance Graphics: Group method

{button ,AL(`H_GROUP_METHOD_MEMDEF_RT;H_SELECTION_CLASS;',0)} See list of classes Group currently selected objects.

Syntax

selectionobject.Group

Parameters

None

Return values

A new instance of a grouped DrawObject.

```
Examples
Dim MyGroup as DrawObject
Set MyGroup = Selection.Group()
```

Freelance Graphics: Import method

{button ,AL(`H_IMPORT_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} See list of classes Import a file.

Syntax

documentobject.Import(filename, includewithfile, converttopostscript, includetemplate, codepage)

Parameters

filename as String Name of the file to import. includewithfile as Integer (Enumerated)

Value	Description		
TRUE (-1)	Include the imported file with the presentation		
FALSE (0)	Do not include the imported file (default)		
converttopostscript as Integer (Enumerated)			

Value	Description
TRUE (-1)	Convert the imported file to PostScript
FALSE (0)	Do not convert the imported file (default)
(Enumerated)	

includetemplate as Integer (Enumerated)

Value	Description
TRUE (-1)	Include the imported template with the presentation
FALSE (0)	Do not include the imported template (default)

codepage as integer

Identifies a special code page for the import operation (defaults to 0).

Return values

The imported object.

Freelance Graphics: InsertCol method {button ,AL(`H_INSERTCOL_METHOD_MEMDEF_RT;H_TABLE_CLASS;',0)} <u>See list of classes</u> Insert a new column as the specified column in a table.

Syntax

tableobject.InsertCol(newcolumnnumber)

Parameters

newcolumnnumber as Integer

The column number of the new column in the table.

Return values

Freelance Graphics: InsertRow method {button ,AL(`H_INSERTROW_METHOD_MEMDEF_RT;H_TABLE_CLASS;',0)} See list of classes Insert a new row as the specified row in a table.

Syntax

tableobject.InsertRow(newrownumber)

Parameters

newrownumber as Integer

The row number of the new row in the table.

Return values

Freelance Graphics: Insert method

{button ,AL(`H_INSERT_METHOD_MEMDEF_RT;H_PLACEMENTBLOCK_CLASS;',0)} <u>See list of classes</u> Insert the specified object in a placement ("Click here...") block.

Syntax

placmentblockobject.Insert object

Parameters

object as DrawObject

The object to be inserted in the "Click here..." block.

Return values

Freelance Graphics: IsEmpty method

{button ,AL(`H_ISEMPTY_METHOD_MEMDEF_RT;H_COLORS_CLASS;H_DOCUMENTS_CLASS;H_OBJECTS_C LASS;H_PAGES_CLASS;',0)} See list of classes

Test if a collection type object (Colors, Documents, Objects, or Pages) is empty (contains no items).

Syntax

objectcollection.lsEmpty

Parameters

None

Return values

Integer (Boolean)

Value	Description
TRUE	There are no items in the object
FALSE	There are one or more items in the object

Examples

If CurrentPage.Objects.IsEmpty() Then Print "There are no objects on this page" End If

Freelance Graphics: Item method

{button ,AL(`H_ITEM_METHOD_MEMDEF_RT;H_COLORS_CLASS;H_DOCUMENTS_CLASS;H_OBJECTS_CLASS;H_OBJECTS_CLASS;H_PAGES_CLASS;',0)} See list of classes

Return an item from a collection type object (Colors, Documents, Objects, or Pages).

Syntax

objectcollection.ltem(index)

Parameters

index as Variant

The index of the item to return, or the name of the color.

Return values

An instance of the Color, Document, DrawObject, or Page class.

Examples

```
Dim MyPage2 as Page
Set MyPage2 = CurrentDocument.Pages.Item(2)
Or
Dim MyBlueColor as Color
Dim MyGreenColor as Color
Set MyBlueColor = CurrentApplication.Colors.Item("Blue")
Set MyGreenColor = CurrentApplication.Colors.Item(35)
```

Freelance Graphics: LeaveEditMode {button ,AL(`H_LEAVEEDITMODE_METHOD_MEMDEF_RT;H_TEXTBLOCK_CLASS;',0)} See list of classes Leave edit mode for the text block (simulate clicking outside that block).

Syntax

textblockobject.LeaveEditMode

Parameters None

Return values None

Freelance Graphics: Maximize method

{button ,AL(`H_MAXIMIZE_METHOD_MEMDEF_RT;H_APPLICATIONWINDOW_CLASS;H_DOCWINDOW_CLASS;' ,0)} See list of classes

Maximize the Freelance application or document window.

Syntax

windowobject.Maximize

Parameters

None

Return values None

Examples

CurrentApplicationWindow.Maximize

or

CurrentDocWindow.Maximize

Freelance Graphics: Minimize method {button ,AL(`H_MINIMIZE_METHOD_MEMDEF_RT;H_APPLICATIONWINDOW_CLASS;H_DOCWINDOW_CLASS;', 0)} See list of classes

Minimize the Freelance application or document window.

Syntax

windowobject.Minimize

Parameters

None

Return values None

Examples CurrentApplicationWindow.Minimize

or

CurrentDocWindow.Minimize
Freelance Graphics: Move method

{button ,AL(`H_MOVE_METHOD_MEMDEF_RT;H_DRAWOBJECT_CLASS;H_PAGE_CLASS;',0)} <u>See list of</u> <u>classes</u>

Move an object to a new position on the page, or move a page to or before the specified page number.

Syntax

drawobject.Move xtwips, ytwips

or

pageobject.Move pagenumber, insertbefore

Parameters

xtwips as Long

Horizontal twips to move (positive moves to right, negative to left).

ytwips as Long

Vertical twips to move (positive moves up, negative down).

pagenumber as Integer

Page number of the new page, or page before which to insert the new page (see note).

insertbefore as Integer (Enumerated)

(Optional)

Value	Description
TRUE (-1)	Insert the page before the specified page number
FALSE (0)	(Default) Insert the page at the specified page number

Return values

Freelance Graphics: NearestColorFromRGB method

{button ,AL(`H_NEARESTCOLORFROMRGB_METHOD_MEMDEF_RT;H_APPLICATION_CLASS;',0)} <u>See list of</u> <u>classes</u>

Return the Freelance Graphics palette color that is the closest match to the specified RGB value.

Syntax

applicationobject.NearestColorFromRGB(rgbvalue)

Parameters

rgbvalue as Long

Any RGB value.

Return values

An instance of the Color class.

Examples

Dim MyColor as Color Set MyColor = CurrentApplication.NearestColorFromRGB(1598564)

Freelance Graphics: NewDocument method

{button ,AL(`H_NEWDOCUMENT_METHOD_MEMDEF_RT;H_APPLICATION_CLASS;',0)} See list of classes Create a new presentation by showing the user interface, with optional parameters supplying default values or selections.

Syntax

applicationobject.NewDocument name, location, kind, mastername, masterlocation

Parameters

Note The first three parameters are ignored. You must save a document to name it.

name as String

Optional file name.

location as Variant

Optional location of the file.

kind as String

Optional file type.

mastername as String

Optional content topic (.SMC) or SmartLook (.MAS) file name.

masterlocation as Variant

Optional content topic set location (must contain a string).

Return values

Returns the new document as an instance of the Document class.

Freelance Graphics: OpenDocumentFromInternet method

{button ,AL(`;H_APPLICATION_CLASS',0)} See list of classes

Available only in Freelance Graphics 97.

Opens an existing .PRZ, .PRE, .SMC, .MAS, .SYM, .DGM, or .PAL document from the Internet, analogous to the OpenDocument function. Returns the document.

Syntax

ApplicationObject.**OpenDocumentFromInternet**(URL, DocType, Password, MakeVisible, UserId, UserPassword, UsePassiveConnection, ProxyServerAddress, ProxyPort, ProxyType)

Parameters

URL As String

Optional. Universal Resource Language location (e.g. "ftp://Radium/users/bob/test.123"), if omitted the interactive dialog will appear to prompt the user.

DocType As String

Optional.

Password As String

Optional.

MakeVisible As Integer

Optional (Freelance Graphics ignors this parameter). Integer used as a boolean: Any non-zero integer is true. False is zero.

Userld As String

Optional. The id required by the host.

UserPassword As String

Optional. The password required for the host.

UsePassiveConnection As Integer

Optional. Integer used as a boolean. True (any non-zero integer is true): your internal network is connected to the Internet through a firewall that supports passive transfers. False (that is, zero): the fire wall does not accept passive transfers.

ProxyServerAddress As String

Optional. Server IP Address or Domain Name

ProxyPort As Integer

Optional. Choose from the available proxy ports.

ProxyType As Integer

Optional. A World Wide Web page is INT_WWW (1) or an FTP file is INT_FTP (2)

Return values

Returns an instance of the Document class.

Usage

Use this method to open a Freelance Graphics file on the internet.

Freelance Graphics: OpenDocumentFromNotes method

{button ,AL(`;H_APPLICATION_CLASS',0)} See list of classes

Available only in Freelance Graphics 97.

Opens a document attached to a Notes document. Returns the document

Syntax

ApplicationObject.**OpenDocumentFromNotes**(AttachedFileName As String, UniversalNotesIs, FieldName, databasePath, ServerName, DocType, Password, OpenAsReadOnly, MakeVisible)

Parameters

AttachedFileName As String

Optional. For example, a file name such as "test.123". If omitted the interactive dialog will appear to prompt the user.

UnvervisalNotesId As String

Optional. For example, "150DFE45F1089B790065828D852562CA"

FieldName As String

Optional. For example, "Body"

DatabasePath As String

Optional. For example, "Databases\Docs in Progress.nsf"

ServerName As String

Optional. For example, "Local"

DocType As String

Optional. For example, ".PRZ"

Password As String

Optional. Password of document to open.

OpenAsReadOnly As Integer

Optional (Freelance Graphics ignores this parameter). Integer used as a boolean: Any non-zero integer is true. False is zero.

MakeVisible As Integer

Optional (Freelance Graphics ignores this parameter). Integer used as a boolean: Any non-zero integer is true. False is zero.

Return values

Returns an instance of the Document class.

Usage

Use this method to open a presentation that is imbedded a Notes docment.

Example

```
CurrentApplication.OpenDocumentFromNotes "test.prz", "somenotesid", _____
"Body", "Progress.nsf", "Local"
```

Freelance Graphics: OpenDocument method

{button ,AL(`H_OPENDOCUMENT_METHOD_MEMDEF_RT;H_APPLICATION_CLASS;',0)} See list of classes Open a presentation for editing.

Syntax

applicationobject. OpenDocument name, location, kind, readonly, makevisible

Parameters

name as String

File name of the presentation file to be opened.

location as Variant

Optional path for the file (must contain a string; defaults to the working directory).

kind as String

Optional file type (defaults to PRZ).

readonly as Integer (Enumerated)

Optional read-only flag.

ValueDescriptionTRUE (-1)Read-onlyFALSE (0)Read-write (default)

makevisible as Integer (Enumerated)

Ignored and always treated as TRUE (this parameter is declared for compatibility with Open methods in other Lotus products).

Value	Description
TRUE (-1)	Visible (default)
FALSE (0)	Invisible (ignored)

Return values

Returns the opened document as an instance of the Document class.

Freelance Graphics: OpenPresForCopy method

{button ,AL(`H_OPENPRESFORCOPY_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} See list of classes Open a presentation from which pages can be copied (similar to the presentation browser, however, this method does not open or use the presentation browser).

Syntax

documentobject.OpenPresForCopy(presentationname)

Parameters

presentationname As String

Name of the presentation file to open in the browser.

Return values

None

Usage

Use this method only in conjunction with two other methods: <u>SelectPageForCopy method</u> and <u>PasteSelectedPages</u> <u>method</u>.

Example

Sub CopyAPage

```
CurrentDocument.OpenPresentationForCopy "turtle.prz"
CurrentDocument.SelectPageForCopy 1
CurrentDocument.PasteSelectedPages 1
```

End Sub

Freelance Graphics: PastePage method

{button ,AL(`;H_DOCUMENT_CLASS',0)} See list of classes

Pastes a page into the current document after the current page.

Syntax

documentobject.PastePage

Parameters

None

Return values

Returns a Page object.

Usage

Before calling this method, a Freelance Graphics page must have been placed on the clipboard by a user or by a script command.

Freelance Graphics: PasteSelectedPages method

{button ,AL(`H_PASTESELECTEDPAGES_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} <u>See list of classes</u> Paste into the document the page(s) copied by the SelectPageForCopy method.

Syntax

documentobject.PasteSelectedPages(pagestartnum)

Parameters

pagestartnum as Integer

Where the selected pages are to be pasted.

Value	Description
0	After the current page
1	Before the current page
2	At the end of the presentation

Return values

Freelance Graphics: PasteSpecial method

{button ,AL(`H_PASTESPECIAL_METHOD_MEMDEF_RT;H_PAGE_CLASS;',0)} <u>See list of classes</u> Paste the Clipboard contents onto the page using a special format (bitmap or chart, for example).

Syntax

pageobject.PasteSpecial(clipboardformat)

Parameters

clipboardformat as String

Any of the Clipboard formats displayed in the Paste Special dialog, or *OLE object* for an OLE object on the Clipboard.

Return values

The pasted object (a new instance of the DrawObject class).

Freelance Graphics: Paste method

{button ,AL(`H_PASTE_METHOD_MEMDEF_RT;H_PAGE_CLASS;',0)} See list of classes

Paste the Clipboard contents onto the page or into the document.

Syntax

object.Paste(makevisible)

Parameters

makevisible as Integer (Enumerated)

Ignored and always treated as TRUE (this parameter is declared for compatibility with Paste methods in other Lotus products).

Value	Description
TRUE (-1)	Make the pasted page(s) visible (default)
FALSE (0)	Make the pasted page(s) invisible (ignored)

Return values

If pasting to a Page, the pasted object (a new instance of the DrawObject class); if pasting to a Document, no return value.

Freelance Graphics: Play method {button ,AL(`H_PLAY_METHOD_MEMDEF_RT;H_MEDIA_CLASS;',0)} See list of classes Play a media object (a sound or a movie).

Syntax

mediaobject.Play

Parameters None

Return values None

Freelance Graphics: PrintOut method

{button ,AL(`H_PRINTOUT_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} <u>See list of classes</u> Print the presentation.

Syntax

documentobject.Print frompage, topage, copies

Parameters

frompage as Integer Starting page number to print. topage as Integer

Ending page number to print.

copies as Integer

Number of copies to print.

Return values

None

Usage

This method is identical to the Print method.

Freelance Graphics: Print method

{button ,AL(`H_PRINT_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} See list of classes Print the presentation.

Syntax

documentobject.Print frompage, topage, copies

Parameters

frompage as Integer Starting page number to print. topage as Integer

Ending page number to print.

copies as Integer

Number of copies to print.

Return values

None

Usage

This method is identical to the PrintOut method.

Freelance Graphics: PublishToWeb method

{button ,AL(`;H_DOCUMENT_CLASS',0)} See list of classes

Available only in Freelance Graphics 97.

Saves a presentation in HTML format (including GIF files, content page, link to presentation, speaker notes, and so on).

Syntax

DocumentObject.**PublishToWeb**(FileName, FileType, Netscape, Resolution, Contents, LinkPres, SpkNote, Media, Email, EmailName, EmailAddr)

Parameters

FileName As String

Name of main HTM file. If directory is not specified, uses work directory. Appends ".HTM", if not specified.

```
FileType As Variant
```

```
Optional parameter.
   $NonHTML20 = Not HTML 2.0 (Default)
   $HTML20CERN = HTML 2.0 CERN
   $HTML20NCSA = HTML 2.0 NCSA
Netscape As Integer
   Optional parameter.
   FALSE = not Netscape Enhanced HMTL 2.0
   TRUE = Netscape Enhanced HMTL 2.0 (Default)
Resolution As Variant
   Optional parameter.
   $Res640x480
   $Res800x600 (Default)
   $Res1024x768
   $Res1280x1024
Contents As Integer
   Optional parameter.
   FALSE = no table of contents
   TRUE = table of contents (Default)
LinkPres As Integer
   Optional parameter.
   FALSE = no link to PRZ file (Default)
   TRUE = add link
LotusLink As Integer
   Optional parameter.
   FALSE = no button linked to Lotus Home Page
   TRUE = add button linked to Lotus Home Page (Default)
SpkNote As Integer
   Optional Parameter.
   FALSE = no speaker notes
   TRUE = publish speaker notes (Default)
Media As Integer
   Optional Parameter.
   FALSE = don't publish multimedia data (Default)
   TRUE = publish multimedia data
```

Email As Integer

Optional Parameter. If this parameter is TRUE, then EmailName and EmailAddr parameters must be included. FALSE = no mail to URL (Default)

TRUE = add mail to URL

EmailName As String

Optional Parameter. However, if Email is True, this parameter must be included.

String for name in mail to URL.

EmailAddr As String

Optional Parameter. However, if Email is True, this parameter must be included. String form email address in mail to URL.

Return values

None.

Usage

You can use PublishToWeb to save a presentation in HTML format.

Freelance Graphics: PutIntoPlacementBlock method

{button ,AL(`H_PUTINTOPLACEMENTBLOCK_METHOD_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of</u> <u>classes</u>

Place an object in a "Click here..." block.

Syntax

drawobject.PutIntoPlacementBlock(placementblockid)

Parameters

placementblockid as Integer

An integer identifying the "Click here..." block.

Return values

Freelance Graphics: Quit method {button ,AL(`H_QUIT_METHOD_MEMDEF_RT;H_APPLICATION_CLASS;',0)} <u>See list of classes</u> Exit Freelance Graphics.

Syntax

applicationobject.Quit

Parameters None

Return values None

Freelance Graphics: RemoveFromSelection method

{button ,AL(`H_REMOVEFROMSELECTION_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;H_PAGESELECTIO N_CLASS;H_SELECTION_CLASS;',0)} See list of classes

Remove the specified object from the set of currently selected objects.

Syntax

objectcollection.RemoveFromSelection object

Parameters

object as DrawObject

The object you want removed from the selection.

Return values

None

Examples

Selection.RemoveFromSelection MyRect2

Freelance Graphics: Remove method {button ,AL(`H_REMOVE_METHOD_MEMDEF_RT;H_DRAWOBJECT_CLASS;H_PAGE_CLASS;',0)} <u>See list of</u> <u>classes</u>

Delete a DrawObject or Page object.

Syntax object.Remove

Parameters

None

Return values None

Examples CurrentSelection.Remove

Freelance Graphics: Replicate method {button ,AL(`H_REPLICATE_METHOD_MEMDEF_RT;H_DRAWOBJECT_CLASS;H_PAGE_CLASS;',0)} <u>See list of</u> <u>classes</u>

Replicate an object.

Syntax

drawobject.Replicate

Parameters

None

Return values

A new instance of the replicated object.

Freelance Graphics: Restore method {button ,AL(`H_RESTORE_METHOD_MEMDEF_RT;H_APPLICATIONWINDOW_CLASS;H_DOCWINDOW_CLASS;' _,0)} See list of classes

Restore the Freelance Graphics application or document window.

Syntax

windowobject.Restore

Parameters

None

Return values

Freelance Graphics: RevertToStyle method

{button ,AL(`H_REVERTTOSTYLE_METHOD_MEMDEF_RT;H_BACKGROUND_CLASS;H_BORDER_CLASS;H_F ONT_CLASS;H_LINESTYLE_CLASS;H_TEXTBLOCK_CLASS;',0)} See list of classes

Revert to the named style for a Background, Border, Font, LineStyle, or TextBlock object.

Note For this release, the RevertToStyle method has no effect any object class.

Syntax

object.RevertToStyle(attributename)

Parameters

attributename AS String Optional input parameter.

Return values

Freelance Graphics: RGBtoColor method

{button ,AL(`H_RGBTOCOLOR_METHOD_MEMDEF_RT;H_COLORS_CLASS;',0)} <u>See list of classes</u> Return the Color class object that matches the <u>RGB value</u> specified.

Syntax

colorsobject.RGBtoColor(colornumber)

Parameters

colornumber as Long An RGB value.

Return values

Color class object matching the RGB value specified.

Examples

Dim MyColor as Color Set MyColor = CurrentApplication.Colors.RGBToColor(1598564)

Freelance Graphics: Rotate method

{button ,AL(`H_ROTATE_METHOD_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> Rotate the object a specified number of degrees around a specified anchor point.

Syntax

drawobject.Rotate xanchor, yanchor, degrees

Parameters

xanchor as Long

Horizontal coordinate of the anchor point in twips.

yanchor as Long

Vertical coordinate of the anchor point in twips.

degrees as Double

Degrees of rotation in a counterclockwise direction.

Return values

Freelance Graphics: RunDialog method

{button ,AL(`H_RUNDIALOG_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} See list of classes Launch one of five hard-coded dialogs.

Syntax

documentobject.RunDialog(dialogtype, dialogcaption, maintext, p4, p5, p6, p7, p8, p9, p10, p11, p12)

Parameters and return values (by dialog type)

The first three parameters are the same for all five dialog types. The usage of parameters 4-12 and the return values vary by dialog type. The common parameters are described first, followed by the dialog-specific parameters and return values for each dialog type.

This method always returns a packed 32-bit (integer) value. In the descriptions of the return values, bit 0 is the least significant bit of the integer.

Common parameters

For all dialogs the first three parameters are always the same.

dialogtype as Integer

Value Description

- 1 Two radio buttons, each with an associated spinner control
- 2 Seven check boxes
- 3 Four radio buttons, optional second text box
- 4 Three check boxes, optional second text box
- 5 List box with up to seven items

dialogcaption as String

The text to display in the caption (title bar) of the dialog.

maintext as String

Instructional text for a display-only text box in the dialog.

The use of the remaining parameters varies depending on the value of first parameter (dialogtype).

Note Parameters 4-10 are always type String, although for some dialog types they contain string representations of numerics. Parameters 11 and 12 are always type Integer.

Type 1 (two radio buttons, each with an associated spinner control) parameters

Paramete	Description
r	
p4	String for first radio button
p5	String for second radio button
p6	String containing the number of the radio button selected initially
p7, p8	Unused
p9	String containing the first spinner minimum value
p10	String containing the first spinner maximum value
p11	Integer containing the second spinner minimum value
p12	Integer containing the second spinner maximum value

Type 1 return values

Bit(s) Description

- 0-7 The value set by the spinner control for the selected radio button when the dialog was closed
- 8 The radio button selected on return:

0 = first

1 = second

9 How the user closed the box:

0 = selected Cancel

1 = selected OK

10-31 Unused

Type 2 (seven check boxes) parameters

Type 2 return values

Paramet r	e Description
p4-p10	 Strings for check boxes 1-7; each parameter is the string to display with the corresponding check box
p11	Initial state of the check boxes; True (non-zero) sets all check boxes as checked; False (zero) sets all check boxes as unchecked.
p12	Unused
Bit(s)	Description
0-6	Indicates which boxes were selected on return:
	0 = not selected
	1 = selected
7	Unused
8	How the user closed the box:

- 0 = selected Cancel
 - 1 = selected OK
- 9-31 Unused

Type 3 (four radio buttons, optional second text box) parameters

Paramete Description r

р4-р7	Strings for radio buttons 1-4; each parameter is the
	string to display with the corresponding radio button

p8 String for optional second text block

p9-p12 Unused

Type 3 return values

Bit(s) Description

- 0-2 A binary number indicating which radio button was selected on return (for example, 110 indicates that button three was selected)
- 3-7 Unused
- 8 How the user closed the box:
 - 0 = selected Cancel
 - 1 = selected OK
- 9-31 Unused

Type 4 (three check boxes, optional secondary text) parameters

Paramet	e Description
r	_
р4-р6	Strings for check boxes 1-3; each parameter is the string to display with the corresponding check box
р7	String for optional secondary text block
p8-p10	Unused
p11	Initial state of the check boxes; True (non-zero) sets all check boxes as checked; False (zero) sets all check boxes as unchecked.
p12	Unused
Bit(s)	Description
0-2	Indicates which boxes were selected on return:
	0 = not selected
	1 = selected
3-7	Unused
8	How the user closed the box:
	0 = selected Cancel
	1 = selected OK

Type 4 return value

Type 5 (list box with up to seven items) parameters

Paramete	Description
r	
p4-p10	Up to seven strings; each string is a separate entry in the list box
p11-p12	Unused

Type 5 return values

Bit(s)	Description

9-31 Unused

0-2	A binary number indicating which item in the list
	box was selected on return (for example, 110
	indicates that item three was selected)

3-7 Unused

```
8 How the user closed the box:
0 = selected Cancel
1 = selected OK
```

```
9-31 Unused
```

Examples

```
' Example of posting Dialog 2 and interpreting results...
DIM PackedVal as Integer
PackedVal = CurrentDocument.RunDialog (2, "DialogTitle", "StaticText",_
"CheckBox 1", "CheckBox 2", "CheckBox 3", "CheckBox 4", "CheckBox 5",_
"CheckBox 6", "CheckBox 7", FALSE, 0)
For I = 1 TO 7
IF PackedVal AND (2^(I-1)) THEN
Print "CheckBox "+Str$(I)+" was enabled."
ELSE
Print "CheckBox "+Str$(I)+" was disabled."
END IF
NEXT I
```

Freelance Graphics: SameColor method

{button ,AL(`H_SAMECOLOR_METHOD_MEMDEF_RT;H_COLOR_CLASS;',0)} <u>See list of classes</u> Compare the color of two Color class objects to determine if they have the same <u>RGB value</u>.

Syntax

colorobject1.SameColor(colorobject2)

Parameters

colorobject2 as Color

An object of class Color.

Return values

Integer (Boolean).

Value	Description
TRUE	Same color
FALSE	Different colors

Examples

```
If Color1.SameColor(Color2) Then
Print "Color2 is identical to Color1"
End If
```

Freelance Graphics: SaveAsToInternet method

{button ,AL(`;H_DOCUMENT_CLASS',0)} See list of classes

Available only in Freelance Graphics 97.

Saves the document to the Internet (analogous to the SaveAs method).

Syntax

DocumentObject.**SaveAsToInternet**(*URL*, *DocType*, *Password*, *UserID*, *UserPassword*, *UsePassiveConnection*, *ProxyServerAddress*, *ProxyPort*, *ProxyType*)

Parameters

URL As String

Optional. Universal Resource Language location (e.g. "ftp://Radium/users/bob/test.123"), if omitted the interactive dialog will appear to prompt the user.

DocType As String

Optional. For example: ".PRZ". The options are: .PRZ, .PRE, .SMC, .MAS, .SYM, .DGM, .PAL, and .HTM.

Password As String

Optional. The document password.

UserID As String

Optional. The user's id for the Internet server.

UserPassword As String

Optional.

UsePassiveConnection As Integer

Optional. Integer used as a boolean. True (any non-zero integer is true): your internal network is connected to the Internet through a firewall that supports passive transfers. False (that is, zero): the fire wall does not accept passive transfers.

ProxyServerAddress As String

Optional. The server IP Address or Domain Name

ProxyPort As Integer

Optional.

ProxyType As Integer

Optional. For a World Wide Web page, use INT_WWW (1); for an FTP file, use INT_FTP (2)

Return values

None.

Usage

Use this method to save files as a given file type to an Internet server.

Freelance Graphics: SaveAsToNotes method

{button ,AL(`;H_DOCUMENT_CLASS',0)} See list of classes

Available only in Freelance Graphics 97.

Saves the document as a Notes attachment.

Syntax

DocumentObject.**SaveAsToNotes**(AttachedFileName, UniversalNotesID, FieldName, DatabasePath, ServerName, DocType, Password)

Parameters

AttachedFileName As String

Optional. For example: "test.123", if omitted the interactive dialog will appear to prompt the user.

UniversalNotesID As String

Optional. For example: "150DFE45F1089B790065828D852562CA"

FieldName As String

Optional. For example: "Body"

DatabasePath As String

Optional. For example: "Databases\Docs in Progress.nsf"

ServerName As String

Optional. For example: "Local"

DocType As String

Optional (Freelance Graphics ignores this parameter). For example: ".PRZ"

Password As String

Optional (Freelance Graphics ignores this parameter). The document password.

Return values

None.

Usage

Use this method to save presentations to a Notes server.

Freelance Graphics: SaveAs method

{button ,AL(`H_SAVEAS_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} Save the current presentation in a new file.

Syntax

documentobject.SaveAs(filename, location, type, backup)

Parameters

filename as String

Optional file name.

location as Variant

Optional path in which to save the file.

type as String

(Optional) File type is ignored for this release. The actual type is always PRZ.

backup as Integer

Indicates if the file should be backed up.

Value	Description
TRUE (-1)	Back up the file
FALSE (0)	Do not back up the file

Return values

Freelance Graphics: Save method {button ,AL(`H_SAVE_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} See list of classes Save the current presentation.

Syntax

documentobject.Save

Parameters None

Return values None

Freelance Graphics: SelectPageForCopy method

{button ,AL(`H_SELECTPAGEFORCOPY_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} <u>See list of classes</u> Select for copying the specified page of a presentation opened with the OpenPresForCopy method.

Syntax

documentobject.SelectPageForCopy(pagenumber)

Parameters

pagenumber as Integer

The number of the page to select for copying.

Return values

Freelance Graphics: Select method {button ,AL(`H_SELECT_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;H_PAGESELECTION_CLASS;H_SELE CTION_CLASS;',0)} See list of classes

Select the specified document, page, or object.

Syntax

selectionclasstype.Select(object)

Parameters

object as objecttype

A Document, DrawObject, or Page object.

Return values None

Examples Selection.Select MyRect
Freelance Graphics: SetInternetOptions method

{button ,AL(`;H_APPLICATION_CLASS',0)} See list of classes

Available only in Freelance Graphics 97.

This method opens the Internet Options dialog box. The user can select any options within the dialog box and then press OK.

Syntax

ApplicationObject.SetInternetOptions

Parameters

None.

Return values None.

Usage

Use this method to connect to a different host or to connect to a host.

Freelance Graphics: SetObjectData method

{button ,AL(`H_SETOBJECTDATA_METHOD_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> Set user-defined object data (persistent, string-valued name and value pair).

Syntax

drawobject.SetObjectData(variablename, variablevalue)

Parameters

variablename as String The name for the variable. variablevalue as String

The value for the variable.

Return values

None

Freelance Graphics: SetViewMode method {button ,AL(`H_SETVIEWMODE_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} <u>See list of classes</u> Set the view mode.

Syntax

documentobject.SetViewMode(mode, pagenumber)

Parameters

mode as Variant

Value	Description
\$ViewDraw	Draw view
\$ViewOutliner	Outliner view
\$ViewSorter	Page Sorter view
\$ViewSlideShow	Screen Show view

pagenumber as Integer

Page number to view.

Return values

None

Freelance Graphics: Show method

{button ,AL(`H_SHOW_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} See list of classes Makes the specified document the active document.

Syntax

documentobject.Show

Parameters

None

Return values

None

Usage

If you are working with multiple documents, use this command to switch between them.

Example

```
' Make two new documents, name them, then use the Show property
' to make first one and then the other document the active document,
' also print the name of the active document in each case.
Set doc1 = CurrentApplication.NewDocument
doc1.SaveAs "Logo1"
Set doc2 = CurrentApplication.NewDocument
doc2.SaveAs "PR_Imag"
doc1.Show
Print CurrentDocument.Name
doc2.Show
Print CurrentDocument.Name
```

Freelance Graphics: StartGuidedTemplate method {button ,AL(`H_STARTGUIDEDTEMPLATE_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} <u>See list of</u> <u>classes</u>

Start using a content topic.

Syntax

documentobject.StartGuidedTemplate(TemplateName)

Parameters

TemplateName As String

Return values

None

Freelance Graphics: StopGuidedTemplate method {button ,AL(`H_STOPGUIDEDTEMPLATE_METHOD_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} See list of classes Stop using a content topic.

Syntax documentobject.StopGuidedTemplate

Parameters None

Return values None

Freelance Graphics: StopPlay method {button ,AL(`H_STOPPLAY_METHOD_MEMDEF_RT;H_MEDIA_CLASS;',0)} See list of classes Stop playing the media.

Syntax mediaobject.StopPlay

Parameters None

Return values None

Freelance Graphics: Stretch method

{button ,AL(`H_STRETCH_METHOD_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> Stretch the object.

Syntax

drawobject.Stretch(xanchor, yanchor, xstart, ystart, xfinish, yfinish, sretchmode)

Parameters

All x and y specifications are twips.

xanchor as Long

Horizontal coordinate of the point from which the object will be stretched.

yanchor as Long

Vertical coordinate of the point from which the object will be stretched.

xstart as Long

Horizontal starting coordinate of the stretch vector.

ystart as Long

Vertical starting coordinate of the stretch vector.

xfinish as Long

Horizontal ending coordinate of the stretch vector.

yfinish as Long

Vertical ending coordinate of the stretch vector.

stretchmode as Integer

Must be zero.

Return values

None

Freelance Graphics: Tile method

{button ,AL(`H_TILE_METHOD_MEMDEF_RT;H_APPLICATIONWINDOW_CLASS;H_DOCWINDOW_CLASS;',0)} See list of classes

Tiles all document windows within the Freelance Graphics application window.

Syntax

windowobject.Tile

Parameters

None

Return values None

Examples

CurrentApplicationWindow.Tile

Freelance Graphics: Ungroup method

{button ,AL(`H_UNGROUP_METHOD_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} See list of classes Ungroup a grouped object.

Syntax

drawobject.Ungroup

Parameters

None

Return values None

Examples Dim MySel as Selection Set MySel = CurrentSelection MySel.Group MySel.Move(50,50) MySel.Ungroup

Freelance Graphics: ActiveDocument property {button ,AL(`H_ACTIVEDOCUMENT_PROPERTY_MEMDEF_RT;H_APPLICATION_CLASS;',0)} <u>See list of classes</u> (Read-only) Get the active presentation document.

Data type

Document

Syntax set documentobject = applicationobject.ActiveDocument

Legal values Any instance of the Document class.

Freelance Graphics: ActiveDocWindow property

{button ,AL(`H_ACTIVEDOCWINDOW_PROPERTY_MEMDEF_RT;H_APPLICATION_CLASS;',0)} See list of classes (Read-only) Get the document window of the active presentation.

Data type

DocWindow

Syntax

set documentwindow = applicationobject.ActiveDocWindow

Legal values

Any instance of the DocWindow class.

Freelance Graphics: ActivePage property

{button ,AL(`H_ACTIVEPAGE_PROPERTY_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the current page, or if in Page Sorter view, the selected page.

Data type

Page

Syntax

set page = documentobject.ActivePage
set documentobject.ActivePage = page

Legal values

Any instance of the Page class.

Freelance Graphics: Active property {button ,AL(`H_ACTIVE_PROPERTY_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} See list of classes (Read-only) Determine if the document is the active presentation.

Data type

Integer (Boolean)

Syntax

value = documentobject.Active

Legal values

Value	Description
TRUE (non-0)	Document is the active presentation
FALSE (0)	Document is not the active presentation

Freelance Graphics: ApplicationWindow property {button ,AL(`H_APPLICATIONWINDOW_PROPERTY_MEMDEF_RT;H_APPLICATION_CLASS;',0)} <u>See list of</u> <u>classes</u>

(Read-only) Get the Freelance Graphics application window.

Data type

ApplicationWindow

Syntax

set applicationwindow = applicationobject.ApplicationWindow

Legal values

Any instance of the ApplicationWindow class.

Freelance Graphics: Application property {button ,AL(`H_APPLICATION_PROPERTY_MEMDEF_RT;H_APPLICATION_CLASS;H_DOCUMENT_CLASS;H_B ASEOBJECT_CLASS;',0)} <u>See list of classes</u>

(Read-only) Get the application.

Data type

Application Document String

Syntax

set object = objecttype.Application

Legal values

Any instance of the Application or Document class; for the BaseObject class, returns "CurrentApplication."

Freelance Graphics: Author property

{button ,AL(`H_AUTHOR_PROPERTY_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} See list of classes (Read-write) Get or set the author of the presentation.

Data type

String

Syntax authorname = documentobject.Author documentobject.Author = authorname

Legal values Any string value.

Freelance Graphics: AutoSaveInterval property

{button ,AL(`H_AUTOSAVEINTERVAL_PROPERTY_MEMDEF_RT;H_PREFERENCES_CLASS;',0)} <u>See list of</u> <u>classes</u>

(Read-write) Get or set the number of minutes between automatic saves.

Note Used only if AutoSave property is TRUE (non-0).

Data type

Integer

Syntax

autosaveinterval = preferencesobject.AutoSaveInterval preferencesobject.AutoSaveInterval = autosaveinterval

Legal values

Any integer.

Examples

CurrentApplication.Preferences.AutoSaveInterval = 5

Freelance Graphics: AutoSave property

{button ,AL(`H_AUTOSAVE_PROPERTY_MEMDEF_RT;H_PREFERENCES_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the Automatic save preference.

Data type

Integer (Boolean)

Syntax

flag = preferencesobject.Autosave preferencesobject.Autosave= flag

Legal values

Value	Description
TRUE (non-0)	Perform automatic saves
FALSE (0)	Do not perform automatic saves

Usage

The time interval for automatic saves is stored in the AutoSaveInterval property.

Examples

CurrentApplication.Preferences.AutoSave = True

Freelance Graphics: AutoTime property

{button ,AL(`H_AUTOTIME_PROPERTY_MEMDEF_RT;H_PAGE_CLASS;',0)} <u>See list of classes</u> (Read-write) During a screen show, controls whether the page displays for the time interval specified in the *pageobject*.Delay property.

Data type

Integer (Boolean)

Syntax value = pageobject.AutoTime pageobject.AutoTime = value

Legal values

Value	Description
TRUE (non-0)	Page displays for the default time interval specified in <i>pageobject</i> .Delay
FALSE (0)	Page remains displayed until the user selects another page

Freelance Graphics: BackColor property

{button ,AL(`H_BACKCOLOR_PROPERTY_MEMDEF_RT;H_BACKGROUND_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the background color of a drawn object.

Data type

Color

Syntax

set color = backgroundobject.BackColor
set backgroundobject.BackColor = color

Legal values

Any instance of the Color class.

Examples

Dim MyColor as Color Set MyColor = MyRect1.Background.BackColor Set MyRect2.Background.BackColor = MyColor

Freelance Graphics: Background property

{button ,AL(`H_BACKGROUND_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the Background property of the object.

Data type

Background

Syntax

set background = drawobject.Background
set drawobject.Background = background

Legal values

Any instance of the Background class.

Usage

You can set a Background to an existing Background, or you can set the individual properties (BackColor, Color, and Pattern) of the Background class.

Examples

Dim MyBackgroundStyle as Background Set MyBackgroundStyle = MyRect.Background Set MyOval.Background = MyBackgroundStyle

Freelance Graphics: BackupDir property

{button ,AL(`H_BACKUPDIR_PROPERTY_MEMDEF_RT;H_PREFERENCES_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the backup directory preference.

Data type

String

Syntax backupdirectory = preferencesobject.**BackupDir** preferencesobject.**BackupDir** = backupdirectory

Legal values Any directory.

Examples

CurrentApplication.Preferences.BackUpDir = "c:\backup"

Freelance Graphics: BlackWhitePal property

{button ,AL(`H_BLACKWHITEPAL_PROPERTY_MEMDEF_RT;H_PREFERENCES_CLASS;',0)} See list of classes (Read-write) Get or set the Black-and-white or Color palette flag.

Data type

Integer (Boolean)

Syntax

flag = preferencesobject.BlackWhitePal preferencesobject.BlackWhitePal = flag

Legal values

Value	Description
TRUE (non-0)	Enable black-and-white palette
FALSE (0)	Disable black-and-white palette

Examples

CurrentApplication.Preferences.BlackWhitePal = True

Freelance Graphics: Blue property

{button ,AL(`H_BLUE_PROPERTY_MEMDEF_RT;H_COLOR_CLASS;',0)} <u>See list of classes</u> (Read-only) Get the amount of blue in a Color object.

Data type

Integer

Syntax *blueamount* = *colorobject*.**Blue**

Legal values 0 (no blue) to 255 (maximum blue).

Examples

Dim AmountOfBlue as Integer AmountOfBlue = MyRect.Background.Color.Blue

Freelance Graphics: Bold property {button ,AL(`H_BOLD_PROPERTY_MEMDEF_RT;H_FONT_CLASS;',0)} <u>See list of classes</u> (Read-write) Determine if the font is bold.

Data type

Integer (Boolean)

Syntax

value = fontobject.Bold fontobject.Bold = value

Legal values

Value	Description
TRUE (non-0)	Bold
FALSE (0)	Not bold

Examples

MyText.TextBlock.Font.Bold = True

Freelance Graphics: BorderDisplay property

{button ,AL(`H_BORDERDISPLAY_PROPERTY_MEMDEF_RT;H_PREFERENCES_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the border display preference.

Data type

Integer (Variant)

Syntax

borderdisplay = preferencesobject.BorderDisplay
preferencesobject.BorderDisplay= borderdisplay

Legal values

Value	Description
\$BorderDispMargin	Display drawing area border (recommended)
\$BorderDispPrintableArea	Display printable area border
\$BorderDispNone	Display no border

Examples

CurrentApplication.Preferences.BorderDisplay = \$BorderDispPrintableArea

Freelance Graphics: Border property

{button ,AL(`H_BORDER_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the Border style for a drawing object.

Data type

Border

Syntax

set border = drawobject.Border
set drawobject.Border = border

Legal values

Any instance of the Border class.

Usage

You can set a Border to an existing Border, but more commonly you will set the individual properties (Color, Pattern, and Width) of the Border class.

Examples

Set MyRect2.Border = MyRect1.Border
or
MyRect1.Border.Width = \$ltsBorderWidthThin

Freelance Graphics: BuildBullets property

{button ,AL(`H_BUILDBULLETS_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-write) Determines if a text block is to be made into a bullet build during a screen show.

Data type

Integer (Boolean)

Syntax

value = drawobject.Buildbullets
drawobject.BuildBullets = value

Legal values

Value	Description
TRUE (non-0)	Make text block into a bullet build during a screen show
FALSE (0)	Do not make text block into a bullet build during a screen show

Freelance Graphics: BulletProperties property

{button ,AL(`H_BULLETPROPERTIES_PROPERTY_MEMDEF_RT;H_TEXTBLOCK_CLASS;',0)} See list of classes (Read-only) Get the bullet properties for a text block.

DataType

BulletProperties

Syntax

set bulletproperties = textblockobject.BulletProperties

Legal values

Any instance of the BulletProperties class.

Usage

You can access or set the individual properties (Color, ShadowColor, ShadowDepth, and so on) of the BulletProperties class.

Freelance Graphics: Case property

{button ,AL(`H_CASE_PROPERTY_MEMDEF_RT;H_FONT_CLASS;',0)} See list of classes

(Read-write) Determine the font case (upper or lower).

Note This property is ignored by Freelance Graphics, and is provided for compatibility with other Lotus products.

Data type

Integer

Syntax fontcase = fontobject.Case fontobject.Case= fontcase

Legal values

Any integer (always returns zero).

Freelance Graphics: Changed property

{button ,AL(`H_CHANGED_PROPERTY_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} <u>See list of classes</u> (Read-write) Determine if the document has changed.

Data type

Integer (Boolean)

Syntax

value = documentobject.Changed
documentobject.Changed = value

Legal values

Value	Description
TRUE (non-0)	Document changed
FALSE (0)	Document has not been changed

Freelance Graphics: Chart property

{button ,AL(`H_CHART_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} See list of classes

(Read-only) Get the Chart property for a drawing object.

Note The Freelance Graphics Chart class is derived from the DrawObject class, and has all the properties and methods of the LotusChart ChartBase class. For more information about the LotusChart ChartBase class, see the Help contents under LotusScript, LotusChart LotusScript Reference, By Category, Classes.

Data type

Chart

Syntax

set chart = drawobject.**Chart**

Legal values

Any instance of the Chart class.

Freelance Graphics: CodePage property

{button ,AL(`H_CODEPAGE_PROPERTY_MEMDEF_RT;H_PREFERENCES_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the code page preference.

Data type

Integer

Syntax

codepage = preferencesobject.CodePage
preferencesobject.Author = codepage

Legal values

Value Description

0 System setting 437 U.S. English 850 Multilingual (Latin I) 852 Slavic (Latin II)

860 Portuguese

863 Canadian French

865 Norwegian

Freelance Graphics: ColCount property {button ,AL(`H_COLCOUNT_PROPERTY_MEMDEF_RT;H_TABLE_CLASS;',0)} <u>See list of classes</u> (Read-only) Get the number of columns in a table.

Data type

Integer

Syntax

columns = tableobject.ColCount

Legal values

Any positive integer.

Freelance Graphics: Colors property

{button ,AL(`H_COLORS_PROPERTY_MEMDEF_RT;H_APPLICATION_CLASS;',0)} See list of classes (Read-only) Get the color palette for an application.

Data type

Colors

Syntax

set colorpalette = colorsobject.Colors

Legal values

Any instance of the Colors class.

Usage

You can use this property to retrieve palettecolors using the RGBToColor, Item, and GetNearestColor methods.

Examples

```
Dim MyPeachColor as Color
Set MyPeachColor = CurrentApplication.Colors.Item(178)
Set MyPeachColor = CurrentApplication.Colors.Item("peach")
Set MyPeachColor = CurrentApplication.Colors.RGBToColor(16764301)
```
Freelance Graphics: Color property

{button ,AL(`H_COLOR_PROPERTY_MEMDEF_RT;H_BACKGROUND_CLASS;H_BORDER_CLASS;H_BULLET_P ROPERTIES_CLASS;H_LINESTYLE_CLASS;',0)} See list of classes

(Read-write) Get or set the color for a background, border, bullet, or line style.

Data type

Color

Syntax

set color = object.Color
set object.Color = color

Legal values

Any instance of the Color class.

Usage

You can set a Color to an existing Color, or you can use the RGBtoColor method to create a new Color from a combination of red, green, and blue. However, once you define a Color object in Freelance Graphics, you cannot modify its Red, Green, or Blue properties individually.

Examples

Dim MyColor as Color Set MyColor = MyLine.LineStyle.Color Set MyRect.Background.Color = MyColor

Freelance Graphics: Count property

{button ,AL(`H_COUNT_PROPERTY_MEMDEF_RT;H_COLORS_CLASS;H_DOCUMENTS_CLASS;H_OBJECTS_C LASS;H_PAGES_CLASS;',0)} See list of classes

(Read-only) Get the number of open presentations, the number of objects in a collection, the number of colors in the palette, or the number of pages in a collection.

Data type

Integer

Syntax

count = object.Count

Legal values

Any integer.

Examples

```
Print "There are " + str$(CurrentDocument.Pages.Count) + " pages in this document."
```

or

Dim NumObjs as Integer NumObjs = CurrentPage.Objects.Count

Freelance Graphics: CurrentPrinter property

{button ,AL(`H_CURRENTPRINTER_PROPERTY_MEMDEF_RT;H_APPLICATION_CLASS;',0)} See list of classes (Read-only) Get the name of the current printer for an application.

Data type

String

Syntax

printername = applicationobject.CurrentPrinter

Legal values

Any printer name.

Freelance Graphics: DefaultFilePath property

{button ,AL(`H_DEFAULTFILEPATH_PROPERTY_MEMDEF_RT;H_APPLICATION_CLASS;',0)} <u>See list of classes</u> (Read-only) Get the application's default file path.

Data type

String

Syntax defaultfilepath = applicationobject.DefaultFilePath

Legal values

Any file path.

Examples

Print "The default file path is " + CurrentApplication.DefaultFilePath

Freelance Graphics: Delay property

{button ,AL(`H_DELAY_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;H_PAGE_CLASS;',0)} See list of classes

(Read-write) Get or set the time delay (in seconds) for a drawing object or page transition during a screen show. For a page, this delay is used only when *pageobject*.AutoTime is TRUE (non-0).

Data type

Integer

Syntax

secondsdelay = object.Delay
object .Delay = secondsdelay

Legal values

Any positive integer.

Freelance Graphics: Description property

{button ,AL(`H_DESCRIPTION_PROPERTY_MEMDEF_RT;H_DOCUMENT_CLASS;H_BASEOBJECT_CLASS;',0)} See list of classes

(Read-write) Get or set the description of the presentation stored in the document, or get the class name of an object.

Data type

String

Syntax

documentobject.**Description** = description description = documentobject.**Description**

Legal values

Any string value.

Freelance Graphics: DimPrevious property

{button ,AL(`H_DIMPREVIOUS_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} See list of classes (Read-write) Determines if the previous items in a bulleted list are to be dimmed during a bullet build (during a screen show).

Data type

Integer (Boolean)

Syntax

value = drawobject.DimPrevious
drawobject.DimPrevious = value

Value	Description
TRUE (non-0)	Dim the previous bullets
FALSE (0)	Do not dim the previous bullets

Freelance Graphics: DisplayCoords property

{button ,AL(`H_DISPLAYCOORDS_PROPERTY_MEMDEF_RT;H_PREFERENCES_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the Display <u>coordinates</u> preference.

Data type

Integer (Boolean)

Syntax

displaycoordinates = preferencesobject.**DisplayCoords** preferencesobject.**DisplayCoords** = displaycoordinates

Legal values

Value	Description
TRUE (non-0)	Display the coordinates
FALSE (0)	Do not display the coordinates

Examples

CurrentApplication.Preferences.DisplayCoords = True

Freelance Graphics: DisplayDrawRuler property {button ,AL(`H_DISPLAYDRAWRULER_PROPERTY_MEMDEF_RT;H_PREFERENCES_CLASS;',0)} <u>See list of</u> <u>classes</u>

(Read-write) Get or set the Display drawing ruler preference.

Data type

Integer (Boolean)

Syntax

flag = preferencesobject.DisplayDrawRuler preferencesobject.DisplayDrawRuler = flag

Legal values

Value	Description
TRUE (non-0)	Display the drawing ruler
FALSE (0)	Do not display the drawing ruler

Examples

CurrentApplication.Preferences.DisplayDrawRuler = True

Freelance Graphics: DisplayGrid property

{button ,AL(`H_DISPLAYGRID_PROPERTY_MEMDEF_RT;H_PREFERENCES_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the Display grid preference.

Data type

Integer (Boolean)

Syntax

flag = preferencesobject.DisplayGrid
preferencesobject.DisplayGrid = flag

Legal values

Value	Description
TRUE (non-0)	Display grid
FALSE (0)	Do not display grid

Examples

CurrentApplication.Preferences.DisplayGrid = True

Freelance Graphics: DisplayTextRuler property

{button ,AL(`H_DISPLAYTEXTRULER_PROPERTY_MEMDEF_RT;H_PREFERENCES_CLASS;',0)} See list of classes

(Read-write) Get or set the Display text ruler preference.

Data type

Integer (Boolean)

Syntax

flag = preferencesobject.DisplayTextRuler
preferencesobject.DisplayTextRuler = flag

Legal values

Value	Description
TRUE (non-0)	Display text ruler
FALSE (0)	Do not display text ruler

Examples

CurrentApplication.Preferences.DisplayTextRuler = True

Freelance Graphics: DocName property {button ,AL(`H_DOCNAME_PROPERTY_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} See list of classes (Read-only) Get the document (file) name for the presentation.

Data type

String

Syntax

documentname = documentobject.DocName

Legal values

Any string value.

Freelance Graphics: Documents property

{button ,AL(`H_DOCUMENTS_PROPERTY_MEMDEF_RT;H_APPLICATION_CLASS;',0)} <u>See list of classes</u> (Read-only) Get the collection of open presentations.

Data type

Documents

Syntax

set documentcollection = applicationobject.Documents

Legal values

Any instance of the Documents class (a collection of Document objects).

Examples

```
ForAll doc in CurrentApplication.Documents
Print doc.DocName
End ForAll
```

or

Dim num as Integer num = CurrentApplication.Documents.Count Print "There are " + str\$(num) + " presentations open."

Freelance Graphics: Document property {button ,AL(`H_DOCUMENT_PROPERTY_MEMDEF_RT;H_PAGE_CLASS;',0)} See list of classes (Read-only) Get the document containing the page.

Data type

Document

Syntax set documentobject = pageobject.Document

Legal values

Any instance of the Document class.

Usage

You can set a Document object to an existing Document, or you can set the individual properties (Author, Description, Location, and so on) of the Document class.

Freelance Graphics: DocWindow property

{button ,AL(`H_DOCWINDOW_PROPERTY_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} <u>See list of classes</u> (Read-only) Get the document window size (width and height).

Data type

DocWindow

Syntax

set documentwindow = documentobject.DocWindow

Legal values

Any instance of the DocWindow class.

Usage

Use this property to get the width and height of the document window.

Freelance Graphics: DoubleUnderline property

{button ,AL(`H_DOUBLEUNDERLINE_PROPERTY_MEMDEF_RT;H_FONT_CLASS;',0)} <u>See list of classes</u> (Read-write) Determine the Double underline (two lines under both words and spaces) font property. **Note** This property is ignored by Freelance Graphics, and is provided for compatibility with other Lotus products.

Data type

Integer (Boolean)

Syntax

flag = fontobject.DoubleUnderline
fontobject.DoubleUnderline = flag

Value	Description
TRUE	Double underline
(non-0)	
FALSE (0)	No double underline

Freelance Graphics: Embedded property {button ,AL(`H_EMBEDDED_PROPERTY_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} See list of classes (Read-only) Determine if the object is embedded.

Data type

Integer (Boolean)

Syntax

flag = documentobject.Embedded

Value	Description
TRUE (non-0)	Embedded object
FALSE (0)	Not an embedded object

Freelance Graphics: Exclude property

{button ,AL(`H_EXCLUDE_PROPERTY_MEMDEF_RT;H_PAGE_CLASS;',0)} <u>See list of classes</u> (Read-write) Determine if the page is excluded from the screen show.

Data type

Integer (Boolean)

Syntax

value = pageobject.Exclude
pageobject.Exclude = value

Value	Description
TRUE	Excluded from screen show
(non-0)	
FALSE (0)	Not excluded from screen show

Freelance Graphics: ExeName property

{button ,AL(`H_EXENAME_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-write) Determine the executable to launch from an object during a screen show.

Data type

String

Syntax

executablename = drawobject.**ExeName** drawobject.**ExeName** = executablename

Legal values

Any legal executable name.

Freelance Graphics: FirstIndent property

{button ,AL(`H_FIRSTINDENT_PROPERTY_MEMDEF_RT;H_TEXTPROPERTIES_CLASS;',0)} See list of classes (Read-write) Get or set the First indent property for the text (the number of twips the first line of text is to be indented).

Data type

Integer

Syntax

indentation = textobject.**FirstIndent** *textobject*.**FirstIndent =** *indentation*

Legal values

Any integer.

Usage

Use the ParaIndent property to set the amount of space you want each paragraph indented.

Freelance Graphics: FontColor property

{button ,AL(`H_FONTCOLOR_PROPERTY_MEMDEF_RT;H_FONT_CLASS;',0)} See list of classes (Read-write) Determine the color for a font.

Data type

Color

Syntax set color = fontobject.FontColor set fontobject.Color = color

Legal values

Any instance of the Color class.

Usage

You can set a FontColor to an existing Color, or you can use the Colors class to set a FontColor to a Color from the Freelance Graphics palette.

Examples

Set MyTextObject1.TextBlock.Font.FontColor = MyColor Set MyTextObject2.TextBlock.Font.FontColor = CurrentApplication.Colors.Item(178)

Freelance Graphics: FontName property

{button ,AL(`H_FONTNAME_PROPERTY_MEMDEF_RT;H_FONT_CLASS;',0)} <u>See list of classes</u> (Read-write) Determine the Font name for a Font class.

Data type String

Syntax fontname = fontobject.FontName fontobject.FontName = fontname

Legal values Any valid font name.

Examples

MyTextObject.TextBlock.Font.FontName = "Arial"

Freelance Graphics: FontUnit property

{button ,AL(`H_FONTUNIT_PROPERTY_MEMDEF_RT;H_APPLICATION_CLASS;',0)} <u>See list of classes</u> (Read-write) Determine the font units of measurement for an application. For Freelance Graphics, this is always points.

Data type

Variant

Syntax

fontunit = applicationobject.FontUnit
applicationobject.FontUnit = fontunit

Legal values

The only legal value is \$ltsScaleModePoint.

Freelance Graphics: Font property

{button ,AL(`H_FONT_PROPERTY_MEMDEF_RT;H_TEXTBLOCK_CLASS;H_TEXTPROPERTIES_CLASS;',0)} See list of classes

(Read-write) Determine the font property for the TextProperties or TextBlock class.

Data type

Font

Syntax

set font = object.Font
set object.Font = font

Legal values

Any instance of the Font class.

Usage

You can set a Font to an existing Font, or you can set the individual properties (Bold, Case, FontColor, and so on) of the Font class.

Examples

```
Dim MyFont as Font
Set MyFont = MyTextObject.TextBlock.Font
MyFont.Bold = True
Set MyTextObject2.TextBlock.Font = MyFont
```

Freelance Graphics: FullName property

{button ,AL(`H_FULLNAME_PROPERTY_MEMDEF_RT;H_APPLICATION_CLASS;H_DOCUMENT_CLASS;',0)} See list of classes

(Read-only) Get the full application or document path name (the full path name includes the executable file name).

Data type

String

Syntax

fullname = object.FullName

Legal values

Any valid full path name.

Freelance Graphics: Green property

{button ,AL(`H_GREEN_PROPERTY_MEMDEF_RT;H_COLOR_CLASS;',0)} <u>See list of classes</u> (Read-only) Get the amount of green in a Color object.

Data type

Integer

Syntax

greenamount = colorobject.Green
colorobject.Green= greenamount

Legal values

0 (no green) to 255 (maximum green).

Examples

Dim AmountOfGreen as Integer AmountOfGreen = MyRect.Background.Color.Green

Freelance Graphics: Height property {button ,AL(`H_HEIGHT_PROPERTY_MEMDEF_RT;H_APPLICATIONWINDOW_CLASS;H_DOCWINDOW_CLASS; H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u>

(Read-only) Get the application window, document window, or drawing object height, in twips.

Data type

Integer (AppWindow, DocWindow classes) Long (DrawObject class)

Syntax

twipshigh = object.Height

Legal values

Any positive value.

Freelance Graphics: HorizontalAlignment property {button ,AL(`H_HORIZONTALALIGNMENT_PROPERTY_MEMDEF_RT;H_TEXTPROPERTIES_CLASS;',0)} <u>See list</u> of classes

(Read-write) Get or set the horizontal alignment property for the text.

Data type

Variant (Enumerated)

Syntax

horizontalalignment = *textobject*.HorizontalAlignment HorizontalAlignment = horizontalalignment

Value	Description
\$ItsAlignmentLeft	Left aligned
\$ItsAlignmentRight	Right aligned
\$ItsAlignmentHorizCenter	Centered horizontally
\$ItsAlignmentJustify	Fit between margins

Freelance Graphics: ID property {button ,AL(`H_ID_PROPERTY_MEMDEF_RT;H_PLACEMENTOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-only) Get the ID for a "Click here..." block.

Data type

Integer

Syntax

idnumber = placementblockobject.ID

Legal values

Any "Click here..." block number.

Freelance Graphics: Image property

{button ,AL(`H_IMAGE_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-only)Get the image properties for a drawing object. This property is valid only if *DrawImageRef*.IsImage is TRUE (non-0).

Data type

Image

Syntax

set image = drawobject.Image

Legal values

Any instance of the Image class.

Usage

You can set an Image to an existing Image, or you can set the individual properties (Brightness, Contrast, Sharpness, and so on) of the Image class.

Freelance Graphics: Interactive property

{button ,AL(`H_INTERACTIVE_PROPERTY_MEMDEF_RT;H_APPLICATION_CLASS;',0)} See list of classes (Read-only) Determine if the application is interactive. For Freelance Graphics, this value is always TRUE (non-0).

Data type

Integer (Boolean)

Syntax

value = applicationobject.Interactive

Value	Description
TRUE	Interactive
(non-0)	
FALSE (0)	Not interactive

Freelance Graphics: IsChart property {button ,AL(`H_ISCHART_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-only) Determine if the object is a chart object.

Data type

Integer (Boolean)

Syntax

value = drawobject.lsChart

Value	Description
TRUE	Chart
(non-0)	
FALSE (0)	Not a chart

Freelance Graphics: IsDraggable property {button ,AL(`H_ISDRAGGABLE_PROPERTY_MEMDEF_RT;H_BASEOBJECT_CLASS;',0)} See list of classes (Read-only) Determine if the object is draggable.

Note Not implemented for this release.

Data type

Integer (Boolean)

Syntax

value = object.lsDraggable

Value	Description
TRUE (non-0)	Draggable
FALSE (0)	Not draggable

Freelance Graphics: IsGroup property

{button ,AL(`H_ISGROUP_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-only) Determine if the object is a grouped object.

Data type

Integer (Boolean)

Syntax

value = drawobject.lsGroup

Legal values

Value	Description
TRUE (non-0)	Grouped
FALSE (0)	Not grouped

Examples

If Selection.IsGroup Then
 Print "Selected DrawObject is a Grouped object."
 Selection.UnGroup

End If

Freelance Graphics: IsImage property {button ,AL(`H_ISIMAGE_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-only) Determine if the object is an image object (a bitmap or graphics metafile, for example).

Data type

Integer (Boolean)

Syntax

value = drawobject.lslmage

Value	Description
TRUE (non-0)	Image
FALSE (0)	Not an image

Freelance Graphics: IsMedia property

{button ,AL(`H_ISMEDIA_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-only) TRUE if object is a media object (a movie or sound, for example).

Data type

Integer (Boolean)

Syntax

value = drawobject.lsMedia

Value	Description
TRUE (non-0)	Movie or sound object
FALSE (0)	Not a movie or sound object
Freelance Graphics: IsOleObj property {button ,AL(`H_ISOLEOBJ_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} See list of classes (Read-only) Determine if the object is an OLE object.

Data type

Integer (Boolean)

Syntax

value = drawobject.lsOleObj

Value	Description
TRUE (non-0)	OLE object
FALSE (0)	Not an OLE object

Freelance Graphics: IsOpen property

{button ,AL(`H_ISOPEN_PROPERTY_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} <u>See list of classes</u> (Read-only) Determine if the presentation document is currently open. In Freelance Graphics, this is always TRUE (non-0).

Data type

Integer (Boolean)

Syntax

value = documentobject.lsOpen

Value	Description
TRUE (non-0)	Open
FALSE (0)	Not open

Freelance Graphics: IsPlacementBlock property {button ,AL(`H_ISPLACEMENTBLOCK_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of</u> <u>classes</u>

(Read-only) Determine if the object is a "Click here..." block.

Data type

Integer (Boolean)

Syntax

value = drawobject.lsPlacementBlock

Value	Description	
TRUE (non-0)	"Click here " block	
FALSE (0)	Not a "Click here" block	

Freelance Graphics: IsSelectable property {button ,AL(`H_ISSELECTABLE_PROPERTY_MEMDEF_RT;H_BASEOBJECT_CLASS;',0)} See list of classes (Read-only) Determine if the object can be selected.

Data type

Integer (Boolean)

Syntax

value = object.lsSelectable

Value	Description	
TRUE (non-0)	Selectable (objects of the DrawObject and Page classes)	
FALSE (0)	Not selectable (all other classes)	

Freelance Graphics: IsTable property {button ,AL(`H_ISTABLE_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-only) Determine if the object is a table object.

Data type

Integer (Boolean)

Syntax

value = drawobject.lsTable

Value	Description	
TRUE (non-0)	Table	
FALSE (0)	Not a table	

Freelance Graphics: IsText property {button ,AL(`H_ISTEXT_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} See list of classes (Read-only) Determine if the object is a text object

Data type

Integer (Boolean)

Syntax

value = drawobject.lsText

Value	Description	
TRUE (non-0)	Text object	
FALSE (0)	Not a text object	

Freelance Graphics: IsValid property

{button ,AL(`H_ISVALID_PROPERTY_MEMDEF_RT;H_BASEOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-only) Determine if the object is valid (still available).

Data type

Integer (Boolean)

Syntax

value = object.lsValid

Legal values

Value	Description
TRUE (non-0)	Valid
FALSE (0)	Not valid

Examples

The following example prints the value zero (FALSE):

MyRect.Cut Print MyRect.IsValid

Freelance Graphics: Italic property

{button ,AL(`H_ITALIC_PROPERTY_MEMDEF_RT;H_FONT_CLASS;',0)} <u>See list of classes</u> (Read-write) Determine the italic attribute for the font.

Data type

Integer (Boolean)

Syntax

value = font.ltalic
font.italic = value

Legal values

Value	Description
TRUE (non-0)	Italicized
FALSE (0)	Not italicized

Examples

MyTextObject.TextBlock.Font.Italic = True

Freelance Graphics: Layout property

{button ,AL(`H_LAYOUT_PROPERTY_MEMDEF_RT;H_PAGE_CLASS;',0)} <u>See list of classes</u> (Read-write) Determine the layout used by the page.

Data type

String

Syntax

layoutname = pageobject.Layout
pageobject.Layout = layoutname

Legal values

Any existing page layout name. Use a zero-length string ("") to refer to the [Blank Page] layout. **Tip** Use the Freelance Graphics user interface to display all page layout names.

Freelance Graphics: Left property {button ,AL(`H_LEFT_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} See list of classes (Read-only) Get the left edge of the object, in twips.

Data type

Long

Syntax *lefttwip* = *drawobject*.Left

Legal values

Any positive value.

Freelance Graphics: LineLead property

{button ,AL(`H_LINELEAD_PROPERTY_MEMDEF_RT;H_TEXTPROPERTIES_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the line leading for the text (the number of points between line skips).

Data type

Integer

Syntax lineleading = textobject.LineLead textobject.LineLead= lineleading

Legal values Any positive integer.

Freelance Graphics: LineStyle property

{button ,AL(`H_LINESTYLE_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the line style property.

Data type

LineStyle

Syntax set linestyleobject = drawobject.LineStyle set drawobject.LineStyle = linestyleobject

Legal values

You can set a LineStyle to an existing LineStyle, or you can set the individual properties (Color, Pattern, and Width) of the LineStyle class.

Examples

MyLine1.LineStyle.Width = \$ltsBorderWidthThin
Set MyLine2.LineStyle = MyLine1.LineStyle

Freelance Graphics: Location property {button ,AL(`H_LOCATION_PROPERTY_MEMDEF_RT;H_APPLICATION_CLASS;H_DOCUMENT_CLASS;',0)} <u>See</u> list of classes

(Read-only) Get the application or document path.

Data type

String

Syntax

path = object.Location

Legal values

Any valid path name.

Freelance Graphics: Media property

{button ,AL(`H_MEDIA_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-only) Get the Media class properties for an object. This property is valid only if *drawobject*.isMedia is TRUE (non-0).

Data type

Media

Syntax

set media = drawobject.Media set drawobject.Media = media

Legal values

Any instance of the Media class.

Freelance Graphics: Name property

{button ,AL(`H_NAME_PROPERTY_MEMDEF_RT;H_COLOR_CLASS;H_DRAWOBJECT_CLASS;H_PAGE_CLASS ;H_BASEOBJECT_CLASS;',0)} See list of classes

(Read-write) Get or set the page or drawing object name; or get the name of any other type of Freelance Graphics object.

Note Read-only except for the Page and DrawObject classes.

Data type

String

Syntax

name = object.Name object.Name = name

Legal values

Any ASCII string value, but may not contain a semi-colon (;) or an equal sign (=).

Examples

```
Dim MyRect as DrawObject
Selection.name = "purple rectangle"
Set MyRect = CurrentPage.FindObject("purple rectangle")
CurrentPage.name = "My Title Page"
Print CurrentPage.Name
```

Freelance Graphics: Number property

{button ,AL(`H_NUMBER_PROPERTY_MEMDEF_RT;H_PAGE_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the page number.

Data type

Integer

Syntax pagenumber = pageobject.Number pageobject.Number = pagenumber

Legal values

From 1 to the number of pages in the presentation.

Usage

To move a page, set the page number to the new page number.

Freelance Graphics: Objects property

{button ,AL(`H_OBJECTS_PROPERTY_MEMDEF_RT;H_PAGE_CLASS;',0)} <u>See list of classes</u> (Read-only) Get a collection of drawing objects on a page.

Data type

ObjectCollection

Syntax

set objectcollection = pageobject.**Objects**

Legal values

Any collection of objects.

Examples

ForAll objs in CurrentPage.Objects
 Print objs.name
End ForAll
Dim MyPage as Page
Dim num as Integer
num = MyPage2.Objects.Count
Print "There are " + str\$(num) + " objects on page 2."

Freelance Graphics: Object property

{button ,AL(`;H_OLEOBJECT_CLASS',0)} See list of classes

Available only in Freelance Graphics 97.

(Read only) Returns the embedded OLE object's automation interface.

Data type

Variant.

Syntax

set MyOLE = OLEObject.Object

Usage

This property returns the embedded object's native automation interface, so that you can access its methods, properties, and so on.

Example

' This example uses the Lotus Draw Component as an OLE object. Dim DrawOCX As DrawObject Dim OCXAuto As Variant

'When an OLE object is on the page, Freelance Graphics assigns a name to the object;

' in this example, the name is Lotus Draw/Diagram Component1.

'Brackets are shorthand notation in LotusScript for the object with the specified name on the current

' page. In this script the object variable, DrawOCX, is set to the Lotus Draw Component on the

' current page.

Set DrawOCX = [Lotus Draw/Diagram Component1]

' Get the OCX's automation interface.

Set OCXAuto = DrawOCX.Object

' Then use interface to access the OCX's scripting language

OCXAuto.CreateSymbol "C:\lotus\Smasters\FLG\Animals.sym", 1

Freelance Graphics: OffsetReplicate property

{button ,AL(`H_OFFSETREPLICATE_PROPERTY_MEMDEF_RT;H_PREFERENCES_CLASS;',0)} See list of classes

(Read-write) Get or set the Offset replicate preference.

Data type

Integer (Boolean)

Syntax

flag = preferencesobject.OffsetReplicate
preferencesobject.OffsetReplicate = flag

Legal values

Value	Description	
TRUE (non-0)	Offset copy from original	
FALSE (0)	Place copy on top of original	

Examples

CurrentApplication.Preferences.OffsetReplicate = True

Freelance Graphics: OleObject property {button ,AL(`H_OLEOBJ_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-only) Get an OLE object.

Data type

Variant

Syntax

set object = drawobject.OleObject

Legal values

As defined by the application that created the object.

Freelance Graphics: Overstrike property

{button ,AL(`H_OVERSTRIKE_PROPERTY_MEMDEF_RT;H_FONT_CLASS;',0)} <u>See list of classes</u> (Read-write) Determine the overstrike attribute for the font. The overstrike characters are typed over existing characters, usually indicating a deletion.

Note This property is ignored by Freelance Graphics, and is provided for compatibility with other Lotus products.

Data type

Integer (Boolean)

Syntax

value = FontRef.Overstrike
FontRef.Overstrike = value

Value	Description	
TRUE (non-0)	Overstrike on	
FALSE (0)	Overstrike off	

Freelance Graphics: PageSelection property {button ,AL(`H_PAGESELECTION_PROPERTY_MEMDEF_RT;H_APPLICATION_CLASS;H_DOCUMENT_CLASS;', 0)} See list of classes

(Read-only) Get the set of pages currently selected in an application or document.

Data type

PageSelection

Syntax

set pageselection = object.PageSelection

Legal values

Any page selection.

Freelance Graphics: Pages property

{button ,AL(`H_PAGES_PROPERTY_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} <u>See list of classes</u> (Read-only) Get pages in the presentation document.

Data type

PageCollection

Syntax

set pagecollection = documentobject.**Pages**

Legal values Any collection of pages in the document.

Examples

ForAll page in CurrentDocument.Pages
 Print page.name
End ForAll
Dim num as Integer
num = MyDocument.Pages.Count
Print "There are " + str\$(num) + " pages in MyDocument."

Freelance Graphics: PageTransitionDelay property

{button ,AL(`H_PAGETRANSITIONDELAY_PROPERTY_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} See list of classes

(Read-write) Get or set the default delay for each page in the presentation when running a screen show.

Data type

Integer

Syntax

secondsdelay = documentobject.PageTransitionDelay
documentobject.PageTransitionDelay = secondsdelay

Legal values

Any positive integer.

Freelance Graphics: PageTransitionEffect property

{button ,AL(`H_PAGETRANSITIONEFFECT_PROPERTY_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} See list of classes

(Read-write) Get or set the screen show page transition effect for each page in the presentation.

Data type

Variant

Syntax

pagetransitioneffect = documentobject.PageTransitionEffect
documentobject.PageTransitionEffect = pagetransitioneffect

Value	Description
\$SSPageReplace	Instant replacement
\$SSPageBottom	From bottom
\$SSPageLeft	From left
\$SSPageRight	From right
\$SSPageBlinds	Blinds opening
\$SSPageLouvers	Louvers opening
\$SSPageBlocks	Block replacement
\$SSPageCenter	From center out
\$SSPageBoxIn	From outer box in
\$SSPageZigZag	Zigzag replacement
\$SSPageHorzIn	Horizontal lines
\$SSPageHVertIn	Vertical lines
\$SSPageTop	From top
\$SSPageBoxOut	From inner box out
\$SSPageHorizOut	Slide out horizontally
\$SSPageVertOut	Slide out vertically
\$SSPageFade	Fade to new
\$SSPageDiagL	Diagonal left
\$SSPageDiagR	Diagonal right
\$SSPagePanL	Pan left
\$SSPagePanR	Pan right
\$SSPageScrollT	Scroll from the top
\$SSPageScrollB	Scroll from the bottom
\$SSPageDraw	Draw new page
\$SSPageRain	Rain new page
\$SSPagePBrush	Paintbrush new page
\$SSPageShade	Shade new page
\$SSPageCurtain	Open curtain
\$SSPageBMPCol	Bitmap by colors

Freelance Graphics: Page property {button ,AL(`H_PAGE_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} See list of classes (Read-only) Get the page on which the drawing object exists.

Data type

Page

Syntax

set pageobject = drawobject.Page

Legal values

Any instance of the Page class.

Freelance Graphics: Paralndent property

{button ,AL(`H_PARAINDENT_PROPERTY_MEMDEF_RT;H_TEXTPROPERTIES_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the Paragraph indent property for the text (the number of <u>twips</u> to indent the paragraph).

Data type

Integer

Syntax indentation = textobject.ParaIndent textobject.ParaIndent = indentation

Legal values Any integer.

Usage

Use the FirstIndent property to set the amount of space you want first line of the paragraph indented.

Freelance Graphics: Paralead property

{button ,AL(`;H_TEXTPROPERTIES_CLASS',0)} See list of classes

(Read-Write) Defines the spacing between paragraphs in a textblock as a percentage of a single-spaced line.

Data type

Integer

Syntax

value = textpropertyobject.Paralead
textpropertyobject.Paralead = value

Legal values

Percentage of a single-space line. For example, 100 indicates double-space, 0 indicates single space, and 50 indicates single spacing plus a half a space, that is, a space and a half. Legal values are from 0 to 900.

Usage

This property does in script what the user interface provides in the Paragraph value of the "Space between Lines, Paragraphs" area of the infobox when a text block is selected (but not being edited). The values for the parameter are related to those shown in the infobox by the formula: Infoboxvalue = (Paralead + 100) / 100.

Freelance Graphics: Parent property

{button ,AL(`H_PARENT_PROPERTY_MEMDEF_RT;H_APPLICATION_CLASS;H_DOCUMENT_CLASS;H_BASEO BJECT_CLASS;',0)} See list of classes

(Read-only) Identify the parent application from which the current application or document was launched; or return the string "CurrentApplication" if the object is not a member of the Application or Document class.

Data type

Application

Document

Syntax

set *parent* = *object*.**Parent**

Legal values

Any instance of the Application or Document class, or the string "CurrentApplication."

Freelance Graphics: Path property {button ,AL(`H_PATH_PROPERTY_MEMDEF_RT;H_APPLICATION_CLASS;H_DOCUMENT_CLASS;',0)} <u>See list of</u> <u>classes</u>

(Read-only) Get the path of the application or document.

Data type

String

Syntax

path = applicationobject.Path

Legal values

Any legal path.

Freelance Graphics: Pattern property

{button ,AL(`H_PATTERN_PROPERTY_MEMDEF_RT;H_BACKGROUND_CLASS;H_BORDER_CLASS;H_LINESTY LE_CLASS;',0)} See list of classes

(Read-write) Get or set a background, border, or line style pattern.

Data type

Variant

Syntax

pattern = object.Pattern
object.Pattern = pattern

Legal values

There are separate values for each class. You can view the patterns in the Properties box of the Freelance Graphics user interface for the appropriate object type, and match them with the names below.

Border class

	Value	Description
	\$ItsBorderPatternNone	
	\$ItsBorderPatternSolid	
	\$ItsBorderPatternDashDot	
	\$ItsBorderPatternDashDotDot	
	\$ItsBorderPatternLongDash	
	\$ItsBorderPatternDashed	same as \$ItsBorderPatternDot
	\$ItsBorderPatternDot	same as \$ItsBorderPatternDashed
LineStyle class		
-	Value	Description
	\$ItsLineStyleNone	- <u> </u>
	\$ItsLineStyleSolid	
	\$ItsLineStyleDashDot	
	\$ItsLineStyleDashDotDot	
	\$ItsLineStyleLongDash	
	\$ItsLineStyleMediumDash	same as \$ItsLineStyleDot
	\$ItsLineStyleDot	same as \$ItsLineStyleMediumDash
Background values		
	Value	Description
	\$ItsFillNone	
	\$ItsFillSolid	
	\$ItsFillGray1	
	\$ItsFillGray2	
	\$ItsFillGray3	
	\$ItsFillGray4	
	\$ItsFillGray5	
	\$ItsFillGray6	
	\$ItsFillGray7	
	\$ItsFillGray8	
	\$ltsFillGray9	same as \$ltsFillGrav10

same as \$ItsFillGray9

\$ltsFillGray10

\$ltsFillLeftDiagonal \$ltsFillRightDiagonal \$ltsFillDiagonalHatch \$ItsFillHorizontal \$ItsFillVertical \$ltsFillRegularHatch \$ItsFillLeftRightGrad \$ltsFillBottomTopGrad \$ltsFillNeToSwGrad \$ltsFillNwToSeGrad \$ltsFillCenterBoxGrad \$ltsFillLowBoxGrad \$ltsFillCenterCircleGrad \$ltsFillLowCircleGrad \$ltsFillNeToSwDiagonalStripGrad \$ltsFillNwToSeDiagonalStripGrad

Examples

MyRect.Border.Pattern = \$ltsBorderPatternDashed
MyRect.Background.Pattern = \$ltsFillGray8
MyLine.LineStyle.Pattern = \$ltsLineStyleDashDot

Freelance Graphics: PlacementBlock property

{button ,AL(`H_PLACEMENTBLOCK_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-only) Get the "Click here..." block properties for a drawing object. These properties are valid only when *drawobject*.isPlacementBlock is TRUE (non-0).

Data type

PlacementBlock

Syntax

set placementblock = placementblockobject.PlacementBlock

Legal values

Any instance of the PlacementBlock class.

Freelance Graphics: PlayPriority property

{button ,AL(`H_PLAYPRIORITY_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the priority with which the object transitions onto the page during a screen show.

Data type

Integer

Syntax

playpriority = drawobject.PlayPriority
drawobject.PlayPriority = playpriority

Legal values

1=first object, 2=second, and so on

Freelance Graphics: Preferences property

{button ,AL(`H_PREFERENCES_PROPERTY_MEMDEF_RT;H_APPLICATION_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the preferences for the application.

Data type

Preferences

Syntax

set preferences = applicationobject.Preferences
set applicationobject.Preferences.individualproperty = preference

Legal values

Any instance of the Preferences class.

Usage

You can get the set of preferences in a Preferences object, or you can get or set the individual properties (AutoSave, AutoSaveInterval, BackupDir, and so on) of the Preferences class.

Examples

CurrentApplication.Preferences.AutoSave = True

Freelance Graphics: Priority property

{button ,AL(`H_PRIORITY_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the drawing priority of a drawing object.

Note You can set the priority of a DrawObject that is a placement block only if you are editing a .MAS or .SMC file, otherwise it is read only.

Data type

Integer

Syntax

priority = drawobject.Priority
drawobject.Priority = priority

Legal values

1=first, 2=second, and so on

Usage

If there are empty placement blocks on the page, they are alway lowest in priority (that is, a priority of one), so that an empty placement block is always behind another drawing object. If you try to put something other than an empty placement block at a priority equal to or lower than the placement block's priority, then you get a message explaining that it cannot be done.

Note Also, the priority of a DrawObject of any kind can never be set higher than the total number of DrawObjects on the page. Also a DrawObject, other than a PlacementBlock, can not be lower in priority than a PlacementBlock.
Freelance Graphics: PromptText property

{button ,AL(`H_PROMPTTEXT_PROPERTY_MEMDEF_RT;H_PLACEMENTBLOCK_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the prompt text for a "Click here..." block.

Data type

String

Syntax prompttext = placementblockobject.**PromptText**

placementblockobject.**PromptText =** prompttext

Legal values Any string value.

Freelance Graphics: ReadOnly property {button ,AL(`H_READONLY_PROPERTY_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} <u>See list of classes</u> (Read-only) Determine if the presentation is read-only.

Data type

Integer (Boolean)

Syntax

value = documentobject.ReadOnly

Value	Description
TRUE (non-0)	Read-only
FALSE (0)	Read-write

Freelance Graphics: Red property

{button ,AL(`H_RED_PROPERTY_MEMDEF_RT;H_COLOR_CLASS;',0)} <u>See list of classes</u> (Read-only) Get the amount of red in a Color object.

Data type

Integer

Syntax

redamount = colorobject.Red

Legal values

0 (no red) to 255 (maximum red).

Examples

Dim AmountOfRed as Integer
AmountOfRed = MyRect.Background.Color.Red

Freelance Graphics: RemoveMedia property

{button ,AL(`H_REMOVEMEDIA_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-only) Determine if the object is on removable media.

Data type

Integer (Boolean)

Syntax

removablemedia = drawobject.RemoveMedia

Value	Description
TRUE (non-0)	On removable media
FALSE (0)	Not on removable media

Freelance Graphics: RightIndent property

{button ,AL(`H_RIGHTINDENT_PROPERTY_MEMDEF_RT;H_TEXTPROPERTIES_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the Right indent property for the text (the number of <u>twips</u> to indent the text).

Data type Integer

Syntax indentation = textobject.RightIndent textobject.RightIndent = indentation

Legal values Any integer.

Freelance Graphics: RowCount property {button ,AL(`H_ROWCOUNT_PROPERTY_MEMDEF_RT;H_TABLE_CLASS;',0)} <u>See list of classes</u> (Read-only) Get the number of rows in a table.

Data type

Integer

Syntax rows = tableobject.RowCount

Legal values

Any positive integer.

Freelance Graphics: ScanSpeed property

{button ,AL(`H_SCANSPEED_PROPERTY_MEMDEF_RT;H_PREFERENCES_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the Scan speed preference (the number of seconds delay between displaying images when scanning in the browser).

Data type

Long

Syntax secondsdelay = preferencesobject.**ScanSpeed** preferencesobject.**ScanSpeed** = secondsdelay

Legal values Any value between .1 and 100.0.

Examples

CurrentApplication.Preferences.ScanSpeed = 36.5

Freelance Graphics: SelectedObjects property

{button ,AL(`H_SELECTEDOBJECTS_PROPERTY_MEMDEF_RT;H_SELECTION_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the collection of currently selected objects.

Data type

Objects

Syntax set selection = objectsobject.SelectedObjects set objectsobject.SelectedObjects = selection

Legal values

Any selection of objects.

Usage

This property is useful for saving and then restoring a selection.

Examples

Dim MySelection as Objects 'clears and restores selection Set MySelection = Selection.SelectedObjects Selection.ClearSelection Set Selection.SelectedObjects = MySelection

Freelance Graphics: SelectionCount property

{button ,AL(`H_SELECTIONCOUNT_PROPERTY_MEMDEF_RT;H_PAGESELECTION_CLASS;H_SELECTION_CLASS;',0)} See list of classes

(Read-only) Get the number of selected pages or objects.

Data type

Integer

Syntax
selectioncount = object.SelectionCount

Legal values

Any integer.

Examples

Dim num as Integer num = Selection.SelectionCount Print "There are " + str\$(num) + " selected objects."

Freelance Graphics: Selection property

{button ,AL(`H_SELECTION_PROPERTY_MEMDEF_RT;H_APPLICATION_CLASS;H_DOCUMENT_CLASS;H_PAG E_CLASS;',0)} See list of classes

(Read-only) Get a selection of objects in the application or document, or on the currently active page.

Data type

Selection

Syntax

set selection = object.Selection

Legal values Any selection of objects.

Examples

Dim MySelection as Selection Set MySelection = CurrentPage.Selection MySelection.Group

Freelance Graphics: ShadowColor property

{button ,AL(`H_SHADOWCOLOR_PROPERTY_MEMDEF_RT;H_BULLET_PROPERTIES_CLASS;H_TEXTPROPE RTIES_CLASS;',0)} See list of classes

(Read-write) Get or set the Shadow color for a bullet or text.

Data type

Color

Syntax set color = shadowobject.ShadowColor set shadowobject.ShadowColor = color

Legal values

Any instance of the Color class.

Freelance Graphics: ShadowDepth property

{button ,AL(`H_SHADOWDEPTH_PROPERTY_MEMDEF_RT;H_BULLET_PROPERTIES_CLASS;H_TEXTPROPER TIES_CLASS;',0)} See list of classes

(Read-write) Get or set the Shadow depth for a bullet or text.

Data type

Variant (Enumerated)

Syntax

shadowdepth = shadowobject.ShadowDepth
shadowobject.ShadowDepth = shadowdepth

Value	Description	
\$ItsShadowDepthShallow	Short shadow	
\$ItsShadowDepthNormal	Normal shadow	
\$ItsShadowDepthDeep	Long shadow	

Freelance Graphics: ShadowDirection property {button ,AL(`H_SHADOWDIRECTION_PROPERTY_MEMDEF_RT;H_BULLET_PROPERTIES_CLASS;H_TEXTPRO PERTIES_CLASS;',0)} See list of classes

(Read-write) Get or set the Shadow direction for a bullet or text.

Data type

Variant (Enumerated)

Syntax

shadowdirection = shadowobject.ShadowDirection shadowobject.ShadowDirection = shadowdirection

Value	Description
\$ItsShadowNone	No shadow
\$ItsShadowBottomRight	Shadow on bottom right
\$ItsShadowBottomLeft	Shadow on bottom left
\$ItsShadowTopRight	Shadow on top right
\$ItsShadowTopLeft	Shadow on top left

Freelance Graphics: Shadow property

{button ,AL(`H_SHADOW_PROPERTY_MEMDEF_RT;H_TEXTPROPERTIES_CLASS;',0)} <u>See list of classes</u> (Read-write) Determine if the text has a shadow.

Note This property is ignored by Freelance Graphics, and is provided for compatibility with other Lotus products.

Data type

Integer (Boolean)

Syntax

flag = textobject.**Shadow** textobject.**Shadow** = flag

Value	Description
TRUE (non-0)	Text shadow
FALSE (0)	No text shadow

Freelance Graphics: Size property {button ,AL(`H_SIZE_PROPERTY_MEMDEF_RT;H_BULLET_PROPERTIES_CLASS;H_FONT_CLASS;',0)} <u>See list</u> of classes

(Read-write) Determine the font or bullet size (in points).

Data type

Double

Syntax

points = object.Size object.Size = points

Legal values

Any positive integer.

Freelance Graphics: SkipWelcome property

{button ,AL(`H_SKIPWELCOME_PROPERTY_MEMDEF_RT;H_PREFERENCES_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the Skip welcome preference.

Data type

Integer (Boolean)

Syntax

flag = preferencesobject.SkipWelcome
preferencesobject.SkipWelcome = flag

Legal values

Value	Description
TRUE (non-0)	Skip Welcome on entry
FALSE (0)	Display Welcome on entry

Examples

CurrentApplication.Preferences.SkipWelcome = True

Freelance Graphics: SmallCaps property

{button ,AL(`H_SMALLCAPS_PROPERTY_MEMDEF_RT;H_FONT_CLASS;',0)} <u>See list of classes</u> (Read-write) Determine if the font displays as Small caps (smaller point size, but all uppercase). **Note** This property is ignored by Freelance Graphics, and is provided for compatibility with other Lotus products.

Data type

Integer (Boolean)

Syntax

value = fontobject.SmallCaps
fontobject.SmallCaps = value

Value	Description
TRUE (non-0)	Small caps
FALSE (0)	No small caps

Freelance Graphics: SmartLook property

{button ,AL(`H_SMARTLOOK_PROPERTY_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the SmartMaster look for the current presentation.

Data type

String

Syntax

smartlook = documentobject.SmartLook
documentobject.SmartLook = smartlook

Legal values

Any existing SmartMaster look.

Note You can use the LotusScript Dir command to list the *.MAS files in the \SMASTERS\FLG directory.

Freelance Graphics: SnapToGrid property

{button ,AL(`H_SNAPTOGRID_PROPERTY_MEMDEF_RT;H_PREFERENCES_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the Snap to grid preference.

Data type

Integer (Boolean)

Syntax

flag = preferencesobject.SnapToGrid
preferencesobject.SnapToGrid = flag

Legal values

Description
Snap objects to grid
Do not snap objects to grid

Examples

CurrentApplication.Preferences.SnapToGrid = True

Freelance Graphics: Sound property

{button ,AL(`H_SOUND_PROPERTY_MEMDEF_RT;H_PAGE_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the file name for a sound associated with the page.

Data type

String

Syntax

soundfilename = pageobject.Sound
pageobject.Sound = soundfilename

Legal values

Any existing sound file name.

Freelance Graphics: SpeakerNoteText property

{button ,AL(`H_SPEAKERNOTETEXT_PROPERTY_MEMDEF_RT;H_PAGE_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the speaker note text displayed on the page.

Data type String

Syntax speakernotetext = pageobject.**SpeakerNoteText** pageobject.**SpeakerNoteText** = speakernotetext

Legal values Any string value.

Freelance Graphics: StartNumber property

{button ,AL(`H_STARTNUMBER_PROPERTY_MEMDEF_RT;H_BULLET_PROPERTIES_CLASS;',0)} See list of classes

(Read-write) Get or set the starting number for numbered bullets.

Data type

Integer

Syntax startnumber = bulletobject.StartNumber bulletobject.StartNumber = startnumber

Legal values

Any integer.

Freelance Graphics: StartupView property

{button ,AL(`H_STARTUPVIEW_PROPERTY_MEMDEF_RT;H_PREFERENCES_CLASS;',0)} See list of classes (Read-write) Get or set the Startup view preference.

Data type

Variant (Enumerated)

Syntax

startupview = preferencesobject.StartupView

preferencesobject.StartupView = startupview

Legal values

Value	Description
\$ViewDraw	Current Page view
\$ViewOutliner	Outliner view
\$ViewSorter	Page Sorter view
\$ViewSlideShow	Screen Show view

Examples

CurrentApplication.Preferences.StartupView = \$ViewSorter

Freelance Graphics: StrikeThrough property

{button ,AL(`H_STRIKETHROUGH_PROPERTY_MEMDEF_RT;H_FONT_CLASS;',0)} See list of classes (Read-write) Determine the strikethrough attribute for the font. Strikethrough is a horizontal line that prints through the middle of existing characters.

Data type

Integer (Boolean)

Syntax

value = fontobject.StrikeThrough
fontobject.StrikeThrough = value

Legal values

Value	Description
TRUE (non-0)	Strikethrough on (for example)
FALSE (0)	Strikethrough off

Examples

MyTextObject.TextBlock.Font.StrikeThrough = True

Freelance Graphics: Style property {button ,AL(`H_STYLE_PROPERTY_MEMDEF_RT;H_BULLET_PROPERTIES_CLASS;',0)} See list of classes (Read-write) Determine the Bullet style.

Data type

Variant (Enumerated)

Syntax

bulletstyle = bulletpropertiesobject.Style bulletpropertiesobject.Style = bulletstyle

\$ItsBulletNone None
\$ItsBulletSmallLetters
\$ItsBulletCapLetters
\$ItsBulletRomanNums
\$ItsBulletDecimalNums
\$ItsBulletSmallDot
\$ItsBulletLargeDot
\$ItsBulletSmallSquare
\$ItsBulletLargeSquare
\$flwBulletDash
\$ItsBulletArrowhead
\$ItsBulletCheck
\$ItsBulletX
\$ItsBulletStar
\$ItsBulletPlus
\$flwBulletCurvedArrowhead
\$ItsbulletRndSquare
\$ItsBulletSmallDiamond
\$ItsBulletLargeDiamond
\$ItsBulletSmallArrowhead

Freelance Graphics: SubScript property

{button ,AL(`H_SUBSCRIPT_PROPERTY_MEMDEF_RT;H_FONT_CLASS;',0)} See list of classes (Read-write) Determine the subscript attribute for the font. Subscripted characters are placed just below the surrounding text.

Note This property is ignored by Freelance Graphics, and is provided for compatibility with other Lotus products.

Data type

Integer (Boolean)

Syntax

value = fontobject.SubScript
fontobject.SubScript = value

Value	Description
TRUE (non-0)	Subscript on
FALSE (0)	Subscript off

Freelance Graphics: SuperScript property

{button ,AL(`H_SUPERSCRIPT_PROPERTY_MEMDEF_RT;H_FONT_CLASS;',0)} <u>See list of classes</u> (Read-write) Determine the superscript attribute for the font. Superscripted characters are placed just above the surrounding text.

Note This property is ignored by Freelance Graphics, and is provided for compatibility with other Lotus products.

Data type

Integer (Boolean)

Syntax

value = fontobject.SuperScript
fontobject.SuperScript = value

Value	Description
TRUE (non-0)	Superscript on
FALSE (0)	Superscript off

Freelance Graphics: Table property

{button ,AL(`H_TABLE_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-write) Get table properties for a drawing object. These properties are valid only when *drawobject*.IsTable is TRUE (non-0).

Data type

Table

Syntax

set *table* = *drawobject*.**Table**

Legal values

Any instance of the Table class.

Freelance Graphics: TemplateDir property

{button ,AL(`H_TEMPLATEDIR_PROPERTY_MEMDEF_RT;H_PREFERENCES_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the content topic directory preference.

Data type

String

Syntax templatedirectory = preferencesobject.**TemplateDir** preferencesobject.**TemplateDir** = templatedirectory

Legal values Any directory.

Examples

CurrentApplication.Preferences.TemplateDir = "c:\lotus\smasters\flg"

Freelance Graphics: TemplatePageCount property {button ,AL(`H_TEMPLATEPAGECOUNT_PROPERTY_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} <u>See list of</u> <u>classes</u>

(Read-only) Get the content topic page count.

Data type

Integer

Syntax pagecount = documentobject.TemplatePageCount

Legal values

Any integer.

Freelance Graphics: TextBlock property

{button ,AL(`H_TEXTBLOCK_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-only) Get the text block properties for a drawing object. These properties are valid only if *drawobject*.isText is TRUE (non-0).

Data type

TextBlock

Syntax

set textblock = drawobject.TextBlock

Legal values

Any instance of the TextBlock class.

Freelance Graphics: TextProperties property

{button ,AL(`H_TEXTPROPERTIES_PROPERTY_MEMDEF_RT;H_TEXTBLOCK_CLASS;',0)} See list of classes (Read-only) Get the text properties for a text block.

Data type

TextProperties

Syntax

set textproperties = textblockobject.TextProperties

Legal values

Any instance of the TextProperties class.

Usage

You can get a set of TextProperties, or you can get or set the individual properties (FirstIndent, Font, HorizontalAlignment, and so on) of the TextProperties class.

Freelance Graphics: TextTightness property {button ,AL(`H_TEXTTIGHTNESS_PROPERTY_MEMDEF_RT;H_FONT_CLASS;',0)} <u>See list of classes</u> (Read-write) Determine the Text tightness for the font.

Note This property is ignored by Freelance Graphics, and is provided for compatibility with other Lotus products.

Data type

Integer

Syntax tightness = fontobject.TextTightness fontobject.**TextTightness =** tightness

Legal values

Any integer (always returns zero).

Freelance Graphics: Text property

{button ,AL(`H_TEXT_PROPERTY_MEMDEF_RT;H_TEXTBLOCK_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the text contained in a text block.

Data type

String

Syntax

text = textblockobject.Text
textblockobject.Text = text

Legal values

Any string value.

Examples

MyTextObject.TextBlock.Text = "This text will appear in the text block"

Freelance Graphics: Title property

{button ,AL(`H_TITLE_PROPERTY_MEMDEF_RT;H_PAGE_CLASS;',0)} <u>See list of classes</u> (Read-only) Get the title text block on a page.

Data type

DrawObject

Syntax

set titleobject = pageobject.Title

Legal values

Any instance of a page title text block.

Usage

You cannot set this property directly, but you can change the page title by changing the underlying Text object (*pageobject*.Title.Textblock.Text).

Freelance Graphics: Top property {button ,AL(`H_TOP_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-only) Get the top edge of an object, in twips.

Data type

Long

Syntax toptwip = DrawObject.**Top**

Legal values

Any positive value.
Freelance Graphics: TransitionEffect property

{button ,AL(`H_TRANSITIONEFFECT_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;H_PAGE_CLASS;',0)} See list of classes

(Read-write) Get or set the transition effect for an object or page during a screen show.

Data type

Variant

Syntax

transitioneffect = object.TransitionEffect
object.TransitionEffect = transitioneffect

Legal values

The legal values vary by class.

Legal values for the Page class

Value	Description
\$SSPageReplace	Instant replacement
\$SSPageBottom	From bottom
\$SSPageLeft	From left
\$SSPageRight	From right
\$SSPageBlinds	Blinds opening
\$SSPageLouvers	Louvers opening
\$SSPageBlocks	Block replacement
\$SSPageCenter	From center out
\$SSPageBoxIn	From outer box in
\$SSPageZigZag	Zigzag replacement
\$SSPageHorzIn	Horizontal lines
\$SSPageHVertIn	Vertical lines
\$SSPageTop	From top
\$SSPageBoxOut	From inner box out
\$SSPageHorizOut	Slide out horizontally
\$SSPageVertOut	Slide out vertically
\$SSPageFade	Fade to new
\$SSPageDiagL	Diagonal left
\$SSPageDiagR	Diagonal right
\$SSPagePanL	Pan left
\$SSPagePanR	Pan right
\$SSPageScrollT	Scroll from the top
\$SSPageScrollB	Scroll from the bottom
\$SSPageDraw	Draw new page
\$SSPageRain	Rain new page
\$SSPagePBrush	Paintbrush new page
\$SSPageShade	Shade new page
\$SSPageCurtain	Open curtain
\$SSPageBMPCol	Bitmap by colors

Legal values for the DrawObject class

Value	Description
\$SSObjReplace	Instant replacement
\$SSObjBottom	From bottom
\$SSObjLeft	From left
\$SSObjRight	From right
\$SSObjBlinds	Blinds opening
\$SSObjLouvers	Louvers opening
\$SSObjBlocks	Block replacement
\$SSObjCenter	From center out
\$SSObjBoxIn	From outer box in
\$SSObjZigZag	Zigzag replacement
\$SSObjHorzIn	Horizontal lines
\$SSObjVertIn	Vertical lines
\$SSObjTop	From top
\$SSObjBoxOut	From inner box out
\$SSObjHorzOut	Slide out horizontally
\$SSObjVertOut	Slide out vertically
\$SSObjFade	Fade to new
\$SSObjDiagL	Diagonal left
\$SSObjDiagR	Diagonal right
\$SSObjRain	Rain new page
\$SSObjFlyL	Fly to the left
\$SSObjFlyR	Fly to the right
\$SSObjFlyU	Fly up
\$SSObjFlyD	Fly down
\$SSObjFlyLD	Fly to the left and down
\$SSObjFlyRD	Fly to the right and down
\$SSObjFlyLU	Fly to the left and up
\$SSObjFlyRU	Fly to the right and up
\$SSObjFlashS	Flash slow
\$SSObjFlashM	Flash medium
\$SSObjFlashF	Flash fast

Freelance Graphics: Type property

{button ,AL(`H_TYPE_PROPERTY_MEMDEF_RT;H_PLACEMENTBLOCK_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the "Click here..." block type.

Data type

Variant

Syntax

type = *placementblockobject***.Type** *placementblockobject***.Type** = *type*

Value	Description
pbTypeText	Click here to enter text
pbTypeSymbol	Click here to add a symbol
pbTypeChart	Click here to create a chart
pbTypeOrgChart	Click here to create an organization chart
pbTypeTable	Click here to create a table
pbTypeButton	Click here to add a button

Freelance Graphics: Underline property

{button ,AL(`H_UNDERLINE_PROPERTY_MEMDEF_RT;H_FONT_CLASS;',0)} <u>See list of classes</u> (Read-write) Determine the Underline attribute for the font. This underline style is a solid line under both words and spaces.

Data type

Integer (Boolean)

Syntax

value = fontobject.Underline
fontobject.Underline = value

Legal values

Value	Description
TRUE (non-0)	Underline on
FALSE (0)	Underline off

Examples

MyText.TextBlock.Font.Underline = True

Freelance Graphics: UndoEnabled property

{button ,AL(`H_UNDOENABLED_PROPERTY_MEMDEF_RT;H_PREFERENCES_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the Undo enabled preference.

Data type

Integer (Boolean)

Syntax

flag = preferencesobject.UndoEnabled

preferencesobject.UndoEnabled = flag

Legal values

Value	Description
TRUE (non-0)	Undo command enabled
FALSE (0)	Undo command disabled

Examples

CurrentApplication.Preferences.UndoEnabled = True

Freelance Graphics: UnitOfMeasure property

{button ,AL(`H_UNITOFMEASURE_PROPERTY_MEMDEF_RT;H_APPLICATION_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the unit of measure used in the application. In Freelance Graphics, this is always <u>twips</u>.

Data type

Variant

Syntax

unitofmeasure = applicationobject.**UnitOfMeasure** applicationobject.**UnitOfMeasure** = unitofmeasure

Legal values

The only legal value is \$ltsScaleModeTwip.

Examples

CurrentApplication.UnitofMeasure = \$ltsScaleModeTwip

Freelance Graphics: UserClassNameApplication property

{button ,AL(`;H_OLEOBJECT_CLASS',0)} See list of classes

Available only in Freelance Graphics 97.

(Read-only) The Windows registry name of the application that corresponds to the OLE object.

Data type

String

Syntax

set MyOLEName = OLEObject.UserClassNameApplication

Legal values

The string value of the following Windows registry key: \CLSID\<{class id}>\AuxuserType\3. To use WordPro as an example, the string value would be: "Lotus WordPro 97".

Usage

Use this property to find the name of the application corresponding to the OLE object that you have found.

Example

```
' This script searches through the current page for an OLE object,
' then determines if the object is a WordPro document.
' If it is, it puts up a message box.
ForAll Obj in CurrentPage.Objects
    If Obj.IsOLEObject then
        If Obj.UserClassNameApplication = "Lotus WordPro 97" then
        MessageBox "This is a WordPro document."
        End If
    End If
End ForAll
```

Freelance Graphics: UserClassNameFull property

{button ,AL(`;H_OLEOBJECT_CLASS',0)} See list of classes

Available only in Freelance Graphics 97.

(Read-only) The full name of the OLE object as registered in the Windows registry.

Data type

String.

Syntax

set MyOLEName = OLEObject.UserClassNameFull

Legal values

The string value of either of the following Windows registry keys: \CLSID\<{class id}>; or \<Prog Id>. To use WordPro as an example, the returned string would be: "WordPro.Document".

Usage

Use this property to find the full name of the OLE object as registered by the Windows registry.

Example

```
' This example searches through the current page for an OLE object,
' then puts the registry name up in a message box.
ForAll Obj in CurrentPage.Objects
    If Obj.IsOLEObject then
        Messagebox "This is the full registry name: " + Obj.UserClassNameFull
    End If
End ForAll
```

Freelance Graphics: UserClassNameShort property

{button ,AL(`;H_OLEOBJECT_CLASS',0)} See list of classes

Available only in Freelance Graphics 97.

(Read-only) The short name of the OLE object as registered in the Windows registry.

Data type

String.

Syntax

set MyOLEName = OLEObject..UserClassNameShort

Legal Values

Returns the string that is in the Windows registry under the following key: \CLSID\<{class id}>\AuxUserType\2. To use WordPro as an example, the returned string would be: "Document."

Usage

Use this property to discover or verify the type of embedded object you have found.

Example

```
' This script searches through the current page for an OLE object,
' a WordPro document. If there is one, then it
' uses the native automation interface of the OLE object (WordPro, in this
' example) to make use of the script language of the OLE object.
ForAll Obj in CurrentPage.Objects
    If Obj.IsOLEObject then
        If Obj.UserClassNameShort = "Document" then
        Obj.Object.DocInfo
        End If
End If
End ForAll
```

Freelance Graphics: VersionID property

{button ,AL(`H_VERSIONID_PROPERTY_MEMDEF_RT;H_BASEOBJECT_CLASS;',0)} <u>See list of classes</u> (Read-only) Determine the version of the code implementing an object. The version number changes for any release that is not 100% compatible with the previous release.

Data type

Long

Syntax value = object.VersionID

Legal values

Any numeric value.

Freelance Graphics: VerticalAlignment property

{button ,AL(`H_VERTICALALIGNMENT_PROPERTY_MEMDEF_RT;H_TEXTPROPERTIES_CLASS;',0)} See list of classes

(Read-write) Get or set the vertical alignment property for the text.

Data type

Variant (Enumerated)

Syntax verticalalignment = textobject.VerticalAlignment textobject.VerticalAlignment = verticalalignment

Legal values

Value	Description
\$ltsAlignmentTop	Align at top
\$ItsAlignmentVertCenter	Center
\$ItsAlignmentBottom	Align at bottom

Examples

MyText.TextBlock.TextProperties.VerticalAlignment = \$ltsAlignmentTop

Freelance Graphics: ViewMode property {button ,AL(`H_VIEWMODE_PROPERTY_MEMDEF_RT;H_DOCUMENT_CLASS;',0)} See list of classes (Read-write) Get or set the view mode.

Data type

Variant (Enumerated)

Syntax

viewmode = documentobject.ViewMode

documentobject.ViewMode = viewmode

Value	Description
\$ViewDraw	Page view
\$ViewOutliner	Outliner view
\$ViewSorter	Page Sorter view
\$ViewSlideShow	Screen Show view

Freelance Graphics: Visible property

{button ,AL(`H_VISIBLE_PROPERTY_MEMDEF_RT;H_APPLICATION_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the visible attribute for the application.

Note For this release, this is effectively read-only, and always TRUE; sets are ignored.

Data type

Integer (Boolean)

Syntax

value = applicationobject.Visible

Value	Description
TRUE	Visible
(non-0)	
FALSE (0)	Not visible

Freelance Graphics: WaitForClick property

{button ,AL(`H_WAITFORCLICK_PROPERTY_MEMDEF_RT;H_DRAWOBJECT_CLASS;',0)} See list of classes (Read-write) Determine if the object needs a mouse click in order to draw the object on the page during a screen show.

Data type

Integer (Boolean)

Syntax

value = drawobject.WaitForClick
drawobject.WaitForClick = value

Value	Description
TRUE (non-0)	Wait for click to draw the object
FALSE (0)	Do not wait for click to draw the object

Freelance Graphics: Width property

{button ,AL(`H_WIDTH_PROPERTY_MEMDEF_RT;H_APPLICATIONWINDOW_CLASS;H_DOCWINDOW_CLASS; H_DRAWOBJECT_CLASS;H_LINESTYLE_CLASS;',0)} See list of classes

(Read-write) Get or set the width of a border or line.

(Read-only) Get the width of the application window, document window, or drawing object.

Data type

Integer (ApplicationWindow and DocWindow classes) Variant (Border and LineStyle classes) Long (DrawObject classes)

Syntax

width = object.Width
object.Width = width

Legal values

ApplicationWindow, DocWindow, and DrawObject classes: any positive value representing the width in <u>twips</u>. Border and LineStyle classes:

Value	Description
\$ItsBorderWidthNone	Thinnest
\$ItsBorderWidthVeryThin	
\$ItsBorderWidthThin	
\$ItsBorderWidthModeratelyThin	
\$ItsBorderWidthMedium	
\$ItsBorderWidthModeratelyThick	
\$ItsBorderWidthThick	
\$ItsBorderWidthVeryThick	
\$ItsBorderWidthExtremelyThick	Thickest

Examples

MyRect.Border.Width = \$ltsBorderWidthThin

Freelance Graphics: WordDoubleUnderline property

{button ,AL(`H_WORDDOUBLEUNDERLINE_PROPERTY_MEMDEF_RT;H_FONT_CLASS;',0)} <u>See list of classes</u> (Read-write) Determine the Word double underline attribute for the font. This is a double line under words but not spaces.

Note This property is ignored by Freelance Graphics, and is provided for compatibility with other Lotus products.

Data type

Integer (Boolean)

Syntax flag = fontobject.WordDoubleUnderline fontobject.WordDoubleUnderline = flag

Value	Description
TRUE (non-0)	WordDoubleUnderline on
FALSE (0)	WordDoubleUnderline off

Freelance Graphics: WordUnderline property

{button ,AL(`H_WORDUNDERLINE_PROPERTY_MEMDÉF_RT;H_FONT_CLASS;',0)} <u>See list of classes</u> (Read-write) Determine the Word underline attribute for the font. This is a single line under words but not spaces. **Note** This property is ignored by Freelance Graphics, and is provided for compatibility with other Lotus products.

Data type Integer (Boolean)

Syntax flag = fontobject.WordUnderline fontobject.WordUnderline = flag

Value	Description
TRUE (non-0)	WordUnderline on
FALSE (0)	WordUnderline off

Freelance Graphics: WorkDir property

{button ,AL(`H_WORKDIR_PROPERTY_MEMDEF_RT;H_PREFERENCES_CLASS;',0)} <u>See list of classes</u> (Read-write) Get or set the Work directory preference.

Data type

String

Syntax worddirectory = preferencesobject.WorkDir preferencesobject.WorkDir = workdirectory

Legal values Any directory.

Examples

CurrentApplication.Preferences.WorkDir = "c:\lotus\work\flg"

Freelance Graphics: Application class Controls a Freelance Graphics session.

coordinates (defined)

The Freelance Graphics coordinate system has its origin (0,0) at the bottom left corner of the page. Coordinates are measured in <u>twips</u> (1/1440 of an inch, or 1/567 of a centimeter). In LotusScript syntax, the horizontal coordinate is usually referred to as *x*, and the vertical coordinate as *y*.

Overview: Scripting in Freelance Graphics

The Application Programming Interface (API) for Freelance Graphics functionality. It is an extension of LotusScript--a cross-product Basic scripting language

You can use LotusScript to automate tasks the user does on a regular basis in Freelance Graphics. For example, you can use LotusScript and the Freelance API to create applications that make it easy to edit a frequently used presentation (by attaching scripts to a SmartMaster). You can also write scripts that:

- Attach to a page, a "Click here..." block, or Smartlcons
- · Operate on documents, pages, and objects
- Make presentations using information gathered from various Lotus products, such as 1-2-3.

With the Freelance Graphics API, you can create "scripts" that execute when you click a button, an icon, or a "Click here..." block. You can also execute a script when you choose Edit - Script - Run.

You use the Script Editor and Debugger to create, edit, and debug scripts.

For more information, scroll down or click one of the following:

Freelance Graphics API rules

- Using names
- Predefined global variables
- Running a script

Sources of information

There is information in the Help system about the Freelance Graphics API (look under Help - Help Topics - LotusScript). There is also context sensitive Help for the Script Editor and Debugger and for the overall LotusScript language.

For more information about programming in LotusScript, use the coupon enclosed with Freelance Graphics to receive the *LotusScript Programmer's Guide*.

The structure of LotusScript

The API and LotusScript use the principles of object-oriented programming. For information about object-oriented programming and LotusScript in Lotus applications, see the *LotusScript Programmer's Guide*.

Classes

The Freelance Graphics API consists of approximately 27 classes (custom LotusScript data types). Each class definition includes a set of properties and methods. A small number of classes also have events.

When you use the Freelance Graphics LotusScript API, a document, for example, is an instance of the Document class. Individual elements on a page, such as a rectangle or a text block, are instances of the DrawObject class. For a list of classes, as well as reference information, see <u>Freelance Graphics LotusScript Classes</u>.

Most Freelance Graphics classes are derived from the BaseObject class. Since the BaseObject class is an abstract class, you never create instances, or objects, of that class.

Some classes are derrived from the DrawObject class and inherit properties and methods from it, such as the Selection class and the PlacementBlock class.

Collection classes

The collection classes in Freelance Graphics (Documents, Pages, Objects, and Colors) inherit from the BaseObject class. They are collections of objects.

The following table shows what indexes the collection classes use.

Class Indexable by

Documents class	Number
Pages class	Number and name
Objects class	Number
Colors class	Name

You can get the index of any object by using the GetIndex property. The index number is by priority. Note that, the current document is always one. For information about collection classes, see the *LotusScript Programmer's Guide*.

Note In Freelance Graphics script syntax, the index of the first item in a collection or table is one. In other Lotus applications (WordPro and Approach, for example) the index of the first item is zero. In the future, script indexing may be standardized across all Lotus applications. If zero becomes the standard for the first collection or table item, you will need to adjust all existing Freelance Graphics script statements containing collection or table references. You can use OPTION BASE to change the indexing base, see the LotusScript Reference for more information.

Class containment heirarchy

At the top of the heirarchy is the Freelance Graphics application. It contains the Documents class, a collection class representing all of the documents currently open in the application, and a Document class, representing individual presentations (.PRZ). Each Document class contains a Pages class, a collection class representing all of the pages in a document, and a Page class, representing an individual page. The Page class contains the DrawObject class, representing an element on the page, such as "Click here..." blocks, charts, and OLE objects.

Properties

Properties define the appearance and behavior of objects. Many object classes have properties defining visual attributes, such as background color, size, and location. Some properties apply to only one object class. For example, the Title property is unique to the Page class. On the other hand, the Width property is a property of the AppWindow, Border, DocWindow, and DrawObject classes.

Some classes may also act as a property for another class. For example, an instance of the Color class can be a property for an instance of the Font class. When a class is a property, the property description tells you.

For a list of properties, see Freelance Graphics LotusScript Properties.

Methods

Methods are subprograms you use to manipulate objects. For example, you can use the Move method to move an instance of the DrawObject class (a rectangle, for example), or you can use the Copy method to copy an instance of the DrawObject class.

For a list of methods, see Freelance Graphics LotusScript Methods.

Events

Events are scriptable actions that are associated with certain classes. For example, you can use the PlacementBlock class Cllick event to run a script when a placement block is clicked.

For a list of events, see Freelance Graphics LotusScript Events.

Freelance Graphics API rules

Using names

Names offer a convenient way of manipulating object and elements in the Freelance Graphics API. In Freelance Graphics every object of Application class, Document class, Page class, and DrawObject class has a default name (however, objects of the Font, Background, Border, and LineStyle classes, and the chart classes do not have default names).

A Document object's name is the file name and is read-only. A DrawObject object has a default descriptive name (such as, PlacementBlock1 or Rectangle1) which can be changed through a script. The name of the page is shown in the Infobox or the IDE; it can be changed by editing the name in the InfoBox or by writing a script. Page 1 is the default name of the first page created in a presentation, Page 2 is the name of the next page, and so on.

The names of all objects with events are listed in the IDE. However, the actual names of the elements (default or otherwise) are not listed in the IDE. To find out the names of all the elements on a page that you can manipulate with a script, run the following script:

```
'Find the names of all objects on this page.
ForAll Objs in CurrentPage.Objects
Print Obj.Name
End ForAll
```

Note Print output appears in the Output window of the IDE.

So, for example, if you have several elements on a page (a text block, a rectangle and an elipse), and you want to manipulate the rectangle, you would use the script described above and learn that the rectangle's name is Rectange1. Once you know the name of an element, you can manipulate it. If you want to move the rectangle, write a script such as the following:

Set Rect = CurrentPage.FindObject("Rectangle1")
Rect.move 1000, 1000

You can even change the element's name. For example:

Rect.name = "Euclid"

Note Once you change the name of an element, you must refer to it by the new name. In the above example, once you renamed "Rectangle1" to "Euclid," you would have to refer to the rectangle as "Euclid," the next time you used the FindObject method, unless, of course, you change the name again.

Freelance Graphics stores the names given to pages and elements in the presentation so that they are available in future script sessions. You can find a draw object if you know its name by using the FindObject method, as demonstrated above, also see <u>FindObject method</u>.

You can use Bind to bind to an instance of the Document, Page, and DrawObject classes. For example:

```
Dim p as Page
Set p = Bind("Page 1")
Print p.number
```

Predefined global variables

Predefined variables let you operate on Freelance Graphics objects:

- CurrentApplication--the current session of Freelance Graphics. Uses the properties and methods of the Application class.
- CurrentApplicationWindow--the application window of the current session of Freelance Graphics. Uses the properties and methods of the ApplicationWindow class.
- CurrentDocument--the current Freelance Graphics document. Uses the properties and methods of the Document class.
- CurrentDocWindow--the current Freelance Graphics document window. Uses the properties and methods of the DocWindow class.
- · CurrentPage--the current page. Uses the properties and methods of the Page class.
- Selection--the currently selected object(s). Uses the properties and methods of the DrawObject class.

For examples of how to use Global variables, see Using LotusScript predefined variables.

Running a script

You can attach scripts to a document, a page, a "Click here..." block, or SmartIcons, and that run when the user performs some action. Or, you can write scripts that run when you choose Edit - Script - Run, or are attached to an icon. These are different processes.

To attach (or assign) a script to a page or a "Click here..." block, you must be in a content topic (see <u>To open a</u> <u>content topic</u>). If the script is attached to a "Click here..." block or a page, it is saved in the content topic itself. The script runs automatically when the user performs some action, such as opening the page or clicking the "Click here..." block. The action depends on which event you choose to use to trigger running the script.

See Attaching a script to a "Click here" block, Attaching a script to a content page, or Creating a script button.

When you want to run a script by choosing Edit - Script - Run, you you first must have saved the script as an LSS or LSO file (a compiled LSS file). You run the script by choosing Edit - Script - Run, and typing the LSS (or LSO) file name.

For information about attaching scripts to SmartIcons, see Attaching a script to an icon.

For information about creating, editing, and debugging a script, see <u>Overview: Creating, editing, and debugging a</u> <u>script</u>.

{button ,AL(`H_FLW_SCRIPT_RUN_STEPS;H_FLW_SCRIPT_CR_ED_DEB_OVER',0)} See related topics

Overview: Creating, editing, and debugging a script

The Script Editor and Debugger in which you write, run, and debug a script has Help. Press F1 when you want information. To launch the Integrated Development Environment (IDE) in Freelance Graphics, choose Edit - Script - Show Script Editor. For more information about working in the Script Editor and Debugger, look under Script Editor or Script Debugger in the Freelance Graphics Help index.

Tip You can also review the list of available Freelance Graphics classes, properties, methods, and events by using the browser in the IDE. You can get help on a highlighted item by pressing F1.

Creating objects and assigning object references

You can access Freelance Graphics objects, including draw objects, pages, and whole presentations, by assigning a reference to that object. References can be assigned to existing objects or to objects that are created within a script.

To assign an existing Freelance Graphics object a reference variable, use the Set statement. Set must be used any time a reference variable is assigned to an instance of a class. For instance:

```
Dim MyPage as Page
Dim MyRect as DrawObject
' Set MyPage equal to the third Page in the presentation and MyRect
' equal to the second item on MyPage.
Set MyPage = CurrentDocument.Pages.Item(3)
Set MyRect = MyPage.Objects.Item(2)
' Set MyRect equal to the object named My Rectangle.
Set MyRect = CurrentPage.FindObject("My Rectangle")
```

To create a Freelance Graphics object, you must use the appropriate method. In general, to create an object follow the method available to the class. For example, the methods for creating draw objects belong to the Page class. To create a rectangle:

Dim MyRect as DrawObject
Set MyRect = CurrentPage.CreateRect (2000, 3000, 3000, 4000)

The method for creating a page belongs to the Document class:

Dim MyPage as Page
Set MyPage = CurrentDocument.CreatePage("Title of Page", 2)

The method for creating a document, NewDocument, belongs to the Application class. For example,

Set MyDoc = CurrentApplication.NewDocument("test.prz")

Using LotusScript predefined product variables

You can use the predefined global variables to write scripts that operate on the currently selected element, page, document, document window, application window, or application.

Selection is a global variable that represents the currently selected element or elements on a page. To change the pattern of the currently selected element or elements on the page:

Sub Main
Selection.Background.Pattern=\$LtsFillGray2
End Sub

CurrentPage represents the current page and uses the properties and methods of the Page class. To delay a page transition on the current page by ten seconds:

```
Sub Main
CurrentPage.PageTransitionDelay=10
End Sub
```

Using global product variables to assign object variables

Use global product variables as a convenient way to access all other objects. Freelance Graphics always maintains valid values for you.

The Set statement must be used any time an object variable is assigned to an instance of a class. Also, the Pages and Objects classes are collections that can be indexed (as in an array). For example:

```
Dim MyRect As DrawObject
Dim MyPage As Page
' Set MyPage equal to the third page in the presentation,
' and MyRect to the second item on MyPage.
Set MyPage = CurrentDocument.Pages(3)
Set MyRect = MyPage.Objects(2)
```

Notice that in the example the predefined global variable, CurrentDocument, is used to refer to the current document and that the collection property, Pages, is used to refer to the third page of the document. Once you use the global variable, CurrentDocument, to assign the object variable, MyPage, the example shows how to use MyPage to refer to an explicit element on a page.

You can access Freelance Graphics elements, including pages and whole presentations, by assigning a reference to that element, page, or presentation. For example, you can assign references to elements that are created within a script or to already existing elements. In the example that follows, note the use of the global variable CurrentPage in combination with the CreateRect method, to assign the object variable, Rect1:

```
Dim Rect1 As DrawObject
' Create a rectangle of default size, then name it MyRect1.
Set Rect1 = CurrentPage.CreateRect
Rect1.Name = "MyRect1"
```

Later in a script you could use the name, MyRect1, that you gave to the rectangle in the above code example, to find the rectangle so that you can manipulate it in some way. You can find an existing named element (for example, MyRect1) on the current page by using the global variable CurrentPage and the FindObject method (a Page Class method that CurrentPage can use). For example:

```
Dim Obj1 As DrawObject
' Find a rectangle named MyRect1.
Set Obj1 = CurrentPage.FindObject("MyRect1")
```

To continue with this example, suppose you wanted to move the rectangle once you found it, use the following line of code. The code makes use of the object variable Obj1 that was set above and the Move method (a method of the DrawObject class, Obj1 is an instance of DrawObject).

```
Obj1.Move 1000,1000
```

Creating objects

To create a Freelance Graphics element, you must use the appropriate method. In general, you create an element by using a method of the appropriate class. You have already seen some examples of creating in the previous section, Using global variables to assign object variables. In this section, Creating objects, you will find more examples.

The methods for creating elements on a page belong to the Page class. For instance, to create a rectangle:

Dim MyRect As DrawObject
Set MyRect = CurrentPage.CreateRect (2000, 3000, 3000, 4000)

In this example, you create a rectangle, MyRect, by using the global variable CurrentPage (it uses the methods and properties of the Page class) and the CreateRect method (a Page class method) to create the rectangle. The numbers in parenthesis give the location and size and width of the rectangle on the page. See Freelance Graphics Reference Help for more information about how to use the CreateRect method.

The method for creating a page belongs to the Document class and so you can use it with the golbal variable CurrentDocument. In the following example the method, CreatePage, takes two parameters, the title of the page and the SmartLook (or template) that the page will be based on.

```
Dim MyPage As Page
Set MyPage = CurrentDocument.CreatePage("Title of Page", 2)
```

As part of the creation process elements and pages are given names by default. These names can be changed by scripts. Freelance Graphics stores the names given to pages and elements in the presentation, so that they are

available in future script sessions. You can assign a variable that references an existing page in the following way:

Dim Pg as Page
Set Pg = CurrentDocument.Pages("Page 1")

Note "Page 1" is the default name of the first page created in the presentation, "Page 2" is the name of the next page, and so on.

To change the name of a page using a script, do the following (continuing with the above example):

Pg.Name = "Agenda"

The NewDocument method for creating a document, belongs to the Application class. The following script creates a new document.

CurrentApplication.NewDocument

Note You must save a document to name it.

Also, the OpenDocument method opens an existing document (in that sense it "creates" a Document object). For example, to open an exisitng presentation (PROPOSAL.PRZ) do the following:

Set MyDoc = CurrentApplication.OpenDocument("proposal.prz")

You use these methods to open or create presentations.

Running a script from the command line

You can run a script by typing

C:\Freelancepath\F32main /r lsscript.lss filename.prz

from the command line.

(*Isscript.Iss* is the name of the script you want to run, and *filename* is the name of the presentation you want to run the script in.)

- In Windows 95, click Start in the taskbar, choose Run, and type the command.
- In Windows NT, Press CTRL+ESC to display the task list, type the command in the New Task edit box, then click the Run button.

Attaching scripts in SmartMaster content files

The advantage of attaching scripts in an .SMC file is that .SMC files are the "templates" for presentation files (.PRZ). Scripts attached to .SMC files can be used each time you create a presentation using the .SMC file. However, scripts attached to a .PRZ file, can only be used in that .PRZ file. Generally speaking you attach scripts to events. For more information on content topics, see <u>Overview: What is a content topic</u> and <u>Overview: Ways to create your own content topics</u>.

Using Events

An event is an action associated with a given class, such as the Click event for the PlacementBlock class. You attach a script to an event. When the event occures, the script runs. There are events associated with the Document class, the Page class, and the Placement block class. For example, the Page class has two events: Activated and Created.

The PlacementBlock class event is Click. Placement blocks, that is, "Click here..." blocks, can, therefore, run a script when the user clicks the placement block.

Placement blocks or "Click here..." blocks

A "Click here..." block, also known in scripting as a placement block, can be either a TextPlacementBlock, a Button, a SymbolPlacementBlock, a ChartPlacementBlock, an OrgChartPlacementBlock, a TablePlacementBlock, or a DiagramPlacementBlock. Once created, all of these placement blocks can have scripts attached to them. You can create placement blocks only while:

- Editing SmartMaster content files (.SMC files)
- · Editing SmartMaster look files (.MAS files)
- · Editing a page layout or backdrop in a .PRZ file

For information about creating and attaching a script to a "Click here" block, see <u>Attaching a script to a "Click here"</u> <u>block</u>.

Attaching scripts to icons

You can attach scripts to icons. For more information on icons, see Attaching a script to an icon.

Sample scripts

For examples of working code and of the object-oriented syntax used in the Freelance Graphics API, review the scripts that are used by SmartMaster content (SMC) files in Freelance Graphics. Scripts in these files refer to the source code contained in the file GTSCRPT.LSS, located in the \LOTUS\SMASTERS\FLG directory.

Caution Modifying script code in this file may cause problems with Freelance Graphics content topics. Make a copy of the file to experiment with.

{button ,AL(`;H_AV_ATTACHING_A_SCRIPT_TO_AN_ICON_STEPS;H_FLW_SCRIPT_IDE_STEPS;H_FLW_SCRIPT_OVER;H_FLW_SCRIPT_RUN_STEPS;H_SMDESIGN_SCRIPT_BUTTON_STEPS',0)} See related topics

Opening the Script Dialog Editor Available only in Freelance Graphics 97.

To open the Script Dialog Editor, choose Edit - Script - Show Dialog Editor.

Opening the Script Editor and Debugger To open the Script Editor and Debugger, choose Edit - Script - Show Script Editor.

{button ,AL(`H_FLW_SCRIPT_OVER;H_FLW_SCRIPT_RUN_STEPS',0)} See related topics

Running a script

Follow these steps to run a script that is not attached to a page or a "Click here..." block.

- 1. Choose Edit Script Run.
- 2. Type the script file name in the File name box.
- 3. Click Open.

Note To see error messages and output, open the Output window; choose Edit - Script - Show Output Window.

Script information for upgraders

Information for upgraders

This topic describes the difference between scripting in Freelance Graphics 96 and Freelance Graphics 97.

For more information, scroll down or click one of the following:

Backward compatability Attaching scripts in .PRZ files Events Objects listed in the IDE Default object names Indexing collections The dialog box editor The transcript window is now the output window Printing from the IDE

Backward compatability

Scripts that were created in Freelance Graphics 96 will run in Freelance Graphics 97. However, scripts written in Freelance Graphics 97 and saved in .PRZ files or .SMC files will not run and cannot be edited in Freelance Graphics 96. If you run an .LSS file created in Freelance Graphics 97 by choosing Edit - Script - Run, the script will work in Freelance Graphics 96 if it does not use any of the new scripting features.

In addition, if you open a Freelance Graphics 97 file containing scripts in Freelance Graphics 96 and then save it, the scripts stored in the file will be lost.

If you open a Freelance Graphics 96 presentation in Freelance Graphics 97, open the IDE, and resave the script, the 96 script format will be converted to the 97 format and these scripts will no longer be recognized by Freelance Graphics 96.

A Freelance Graphics 96 .LSO file will run in Freelance Graphics 97. However, a Freelance Graphics 97 .LSO may fail in Freelance Graphics 96.

Attaching scripts in .PRZ files

In Freelance Graphics 97 you can attach scripts to objects in .PRZ files (presentation files) as well as .SMC files (SmartMaster with content files). In Freelance Graphics 96 you could only attach scripts to .SMC files. However, as a general rule, .SMC files are the most useful files to put scripts in.

Events

Freelance Graphics now has events for the following classes:

Class	Events
Document class	Activated, Created, Opened, PageCreated, PreClose, Save, SaveAs, Saved, SavedAs, SMCStarted
Page class	Activated, Created

PlacementBlock class Clicked

For more information about these events, see Freelance Graphics LotusScript Events A-Z.

Objects listed in the IDE

On the current page, you can see the list of objects that have event handlers in the Object drop-down box of the IDE. You can use the drop-down box description in a script as a reference to the object it represents, but you must put square brackets around it. For example:

[SymbolPlacementBlock1].Insert(MyCircle1)

Using the name of an object as listed in the IDE is a simple way of manipulating the object in a script.

Default object names

In Freelance Graphics 97 all instances of the DrawObject class have default names (not just the page and the document as in Freelance Graphics 96). For information about using names in a script see, <u>Using names</u>.

Indexing collections

The following table shows what indexes the collection classes use.

Class Indexable by

Documents class	Number
Pages class	Number and name
Objects class	Number
Colors class	Name

In Freelance Graphics, the numerical index value of the first item in a collection is one. In other Lotus products (Word Pro and Approach, for example) the index of the first item is zero.

Note You can use the Option Base statement to change the indexing base, see the *LotusScript Language Reference* for more information.

The dialog box editor

Freelance Graphics 97 has a dialog box editor. The editor offers more flexibility than the RunDialog method, however, the RunDialog method is still available. For more information about the dialog editor; open the editor, by choosing Edit - Scipt - Show Dialog Editor, then choose Help.

The transcript window is now the output window

The Transcript window was used in Freelance Graphics 96 to show error messages and output. However, in Freelance Graphics 97, error messages (generated by Event handlers and scripts run through the IDE) appear in the error message box of the IDE.

In Freelance Graphics 97 the Transcript window is now refered to as the Output window. It automatically comes up when a script error happens outside of the IDE, for example, when you run a script by choosing Edit - Script - Run or when you run a script from an icon. In addition, when you run presentations containing scripts that were created in Freelance Graphics 96, the only way you can see error messages is by opening the Output window, that is, by choosing Edit - Script - Show Output Window.

Printing from the IDE

You can print a script from the IDE in Freelance Graphics 97; from the IDE menu choose File - Print Script.

Frequently-asked questions

Here are some tips and scripts for Freelance Graphics covering <u>common tasks</u>, <u>general issues</u>, and <u>troubleshooting</u>. For more information, scroll down or click one of the following:

How do I trouble shoot?

Why doesn't my attached script run? Can I create multiple buttons?

Common Tasks

How do I create a placement block (that is, a button or a "Click here..." block)?

You must be editing a SmartMaster with content file (that is, an .SMC file), a SmartLook file (a .MAS file), or a page layout or backdrop in a .PRZ file. To create a button or a "Click here..." block choose Create - "Click here" Block. You can then attach scripts to the "Click here..." block by making use of the placement block Click event.

Note There are several instances of the PlacementBlock class in Freelance Graphics: TextPlacementBlock, SymbolPlacementBlock, ChartPlacementBlock, OrgChartPlacementBlock, TablePlacementBlock,

DiagramPlacementBlock, and Button. You can specify the type when you create the placement block;

TextPlacementBlock is the default. Do not confuse the TextPlacementBlock with the TextBlock, they are different. A TextBlock does not have an event associated with it, and a script cannot be attached to it.

How do I attach a script to a placement block (that is, a button or a "Click here..." block)?

You must be editing a SmartMaster with content (that is, an .SMC file) or a presentation file (.PRZ) that already has "Click here..." blocks or buttons. Open the IDE choosing Edit - Script - Open Editor or, if you are editing a .SMC file, you can open the InfoBox for the button or "Click here..." block, click the Basics panel and open the IDE from there, using the Edit/Create button. Then you use the placement block Click event to write a script that runs when the user clicks the "Click here..." block.

In short, you can attach a script any element that has an Event associated with it: a placement block, a page, or a document.

How do I create a new presentation?

You can use the NewDocument method to create a new Freelance Graphics presentation. The following example creates a new presentation in a separate window, leaving the current presentation still open in its own window.

CurrentApplication.NewDocument "MyPresentation", , "buttons.mas"

How do I copy and paste an object?

You can use the Replicate method or the Copy and Paste method to create a duplicate of an element.

```
Sub MakeReplicate
```

```
Dim MyRectangle as DrawObject
Dim NewCopy as DrawObject
' Assign object variables, create a rectangle and make a replicate of it.
MyRectangle = CurrentPage.CreateRect
Set NewCopy = MyRectangle.Replicate
```

End Sub

You can use the Copy and Paste methods with any object or group of objects on the page. For example:

```
Sub ClipboardDemo
```

```
Dim MyRectangle as DrawObject
' Make a new rectangle
MyRectangle = CurrentPage.CreateRect
' Copy the rectangle to the clipboard
MyRectangle.Copy
' Pastes clipboard contents onto the page
Set NewObj = CurrentPage.Paste
```

End Sub

How do I change the view?

You can change between Current Page view, Outline view, or the Sorter view:

```
CurrentDocument.ViewMode = $ViewOutliner
CurrentDocument.ViewMode = $ViewSorter
CurrentDocument.ViewMode = $ViewDraw
```

Most product commands are available from Current Page view, and Current Page view should be used for most scripts.

Note Many script commands do not alter the appearance of the screen. So, while a script runs, you may not see any action taking place.

How do I add pages?

You can use the CreatePage or CreatePageFromTemplate (when there is an active Content SmartMaster) commands to add new pages. Either of the following examples will work.

Example 1:

```
' Add a title page
CurrentDocument.CreatePage "My title page", 1
' Or, you can add a title page from the current content Smart Master.
CurrentDocument.CreatePageFromTemplate "A Content SmartMaster " +_
    "title page", 1
```

Example 2:

In this example, the object variable, MyPage, is identified with the page that is created.

```
' Add a title page and assign an object variable to the new page.
Set MyPage = CurrentDocument.CreatePage ("My title page", 1)
```

```
' Or, you can add a title page from the current content Smart Master
Set MyPage = CurrentDocument.CreatePageFromTemplate _
    ("A Content SmartMaster page", 1)
```

How do I change the look of a presentation?

You can change the look of the current presentation by setting the SmartLook property:

' Change the look to the Buttons SmartMaster set. CurrentDocument.SmartLook = "buttons.mas"

How do I add a block of text to a page?

As in the user interface, there are two ways to add text to a presentation page with LotusScript.

- Create a new text object on the page
- · Fill in an existing text block.

To create a new text object on the current page, use the CreateText command as follows:

Set MyTextBlock = CurrentPage.CreateText
MyTextBlock.Text = "Here's a line of text"

There are three ways to access an element iin a presentation. In what follows, the examples use each of these three ways to access an existing text block:

1. You can assign a DrawObject variable to the text block. For example:

```
Set MyClickHere = Bind DrawObject("Text2")
' Use the variable and the Text method to put text into the object.
MyClickHere.Text = "Here is a line of text"
```

2. If the desired text block is selected, you can access it through the current selection:

- Selection.Textblock.Text = "Here is a line of text."
- 3. You can iterate over the objects on the current page and find a "Click here..." block (that is, a placement block) and then put text in it. Note, when you put text in a placement block, it becomes a text block and it is no longer recognized as a placement block.

```
ForAll obj in CurrentPage.Objects
    If obj.IsPlacementBlock Then
        If obj.Type = $pbTypeText then
            obj.Text = "Here's a line of text."
        End If
    End If
End ForAll
```

How do I add clip art?

You can use the CreateSymbol command to add existing clip art or diagrams to the current page.

```
' Add the 3rd animal clip art drawing CreateSymbol "animals", 3
```

or

```
Set MySymbol = CreateSymbol ("animals", 3)
```

To place a symbol in an existing placement block, you can iterate through all of the elements on the current page until you find a placement block object.

```
ForAll obj in CurrentPage.Objects
    If obj.IsPlacementBlock Then
        If obj.PromptText = "Click here to add clip art" Then
        obj.insert CreateSymbol ("animals", 3)
        End If
    End If
End ForAll
```

How do I rearrange the pages of a presentation?

You can move pages by setting their page number.

ThisPage = CurrentPage.Number CurrentPage.Number = ThisPage + 2

How do I print a presentation?

The Print method prints the active presentation to the current printer.

CurrentDocument.Print

How do I run a presentation as a screen show?

Under LotusScript, a screen show is another view mode. You can start a presentation as a screen show from script by changing the ViewMode property.

CurrentDocument.ViewMode = \$ViewSlideShow

General issues

Is there a list of all classes, properties, methods, and events I can access in a presentation?

For a complete list of classes, properties, methods, and events see <u>Freelance Graphics LotusScript A-Z</u>. You can also see a list of properties, methods, and events for each class in the IDE.

How do I access text in a TextBlock

Here are two examples of how to access a text block .:

1. You can assign a DrawObject variable to the text block then alter the text.

```
Set MyClickHere = Bind DrawObject("Subtitle")
MyClickHere.TextBlock.Text = "Here's a line of text"
```

Note You can use Bind to bind to instances of the Document, Page, and DrawObject classes.

2. If the desired text block is selected, you can access it by using the current selection:

Set MyClickHere = Selection.Textblock

How do I add multiple lines of text to a text block?

To convert lines of text from another source to a text block, you first convert the text to Freelance Graphics markup format, which uses the characters "<=" in place of carriage return and line feed characters.

The following function converts a Notes-formatted string to a markup-formatted string:

Function ConvStrForFLG (Str1 As String) As String

```
' Converts a Notes string to a string that FLG can use --
' i.e. converts the carriage return / line feed
 (chr(13) / chr(10)) to equivalent markup characters ("<=").
۲
   Inputs: Str1 - string to convert
۲
    Outputs: none
   Returns: converted string in markup form
Dim pStr1, pStr2 As Integer
ConvStrForFLG$ = ""
pStr1 = 1
pStr2 = Instr (Str1, Chr$(13))
' Convert embedded CR/LF
Do While pStr2 <> 0
   ConvStrForFLG$ = ConvStrForFLG$ +
     Mid$ (Str1, pStr1, pStr2 - pStr1) + "<="
   pStr1 = pStr2 + 2
  pStr2 = Instr(pStr1, str1, Chr$(13))
Loop
' Handle last part of string
If Len (Mid$(Str1, pStr1)) <> 0 Then
   ConvStrForFLG$ = ConvStrForFLG$ + Mid$(Str1, pStr1)
End If
```

End Function

How do I search and replace text?

LotusScript in Freelance Graphics provides no direct methods for searching and replacing text in this release. However, search and replace functions are available to the user under the Freelance Graphics Edit menu.

You can write a script that searches the document for text blocks, then extracts text strings, and then does compares with each string member.

Troubleshooting

Why doesn't my attached script run when I click the button?

There are two possibilities:

 If a placement block has been filled in with text, a chart, and so on, then it is no longer identified as a placement block. Any script that operates on that placement block will no longer recognize it as a placement block and the script will fail to execute. For example, if you are searching for a placement block, but all there is on the page is a "Click here..." block that is now filled in with text, then using IsPlacementBlock will not recognize any placement block on the page. On the other hand, IsTextBlock will recognize the block. Note If you delete the text that was entered into a "Click here..." block, then it is recognized as a placement block again.

2. If a placement block is renamed in the course of a script's execution or by user intervention, then the changed name will cause a script that looks for that placement block using the old name to fail. For example, if "TextPlacementblock1" gets renamed "My block," the script that works on that placement block would have to take the name change into account, or else the script will fail.

Can I create multiple buttons with attached scripts on a page?

Yes, multiple buttons are accessible from a SmartMaster content (.SMC) file and from a SmartMaster look (.MAS) file.

'// In this example, a message box comes up when Freelance Graphics has created a new
page.//
Sub PageCreated(Source As Page)
 MessageBox " A new page has just been created. "
End Sub

```
' Example: Quit event
'// In this example, a message box comes up Freelance Graphics receives a //
'// command to shut down.//
Sub Quit(Source As Application)
        MessageBox " Freelance Graphics is about to shut down. "
End Sub
```

' Example: SavedAs event
'// In this example, a message box comes up when Freelance Graphics has saved //
'// a presentation as a .PRZ file or as another file type.//
Sub SavedAs(Source As Document)
 MessageBox " The presentation has been saved as the file type you chose. "

End Sub

```
' Example: Saved event
'// In this example, a message box comes up when Freelance Graphics has saved //
'// a presentation.//
Sub Saved(Source As Document)
    MessageBox " The presentation has been saved. "
End Sub
```

```
' Example: Save event
'// In this example, a message box comes up when Freelance Graphics receives a
command//
'// to save a presentation.//
Sub Save(Source As Document)
        MessageBox " Freelance Graphics is about to save this file. "
End Sub
```

Freelance Graphics: Activated event (Document)

{button ,AL(`;H_DOCUMENT_CLASS',0)} <u>See list of classes</u> {button ,AL(`H_EXAMPLE_FLG_ACTIVATED_DOCUMENT_EVENT_MEMDEF',1)} <u>See example</u> Available only in Freelance Graphics 97. Raised each time Freelance Graphics has finished activating a presentation.

Syntax

Activated(Source As Document)

Parameters

Source As Document

Represents the active presentation as a Document object.

Usage

Use this event to run a script when Freelance Graphics has completed activating a presentation file (.PRZ).

Freelance Graphics: Activated event (Page)

{button ,AL(`;H_PAGE_CLASS',0)} <u>See list of classes</u> {button ,AL(`H_EXAMPLE_FLG_ACTIVATED_PAGE_EVENT_MEMDEF',1)} <u>See example</u> Available only in Freelance Graphics 97. Raised each time Freelance Graphics has finished activating a page.

Syntax

Activated(Source As Page)

Parameters

Source As Page

Represents the activated page as a Page object.

Usage

Use this event to run a script when Freelance Graphics has completed activating a page. That page is now the current page.

Freelance Graphics: Clicked event

{button ,AL(`;H_PLACEMENTBLOCK_CLASS',0)} <u>See list of classes</u> {button ,AL(`H_EXAMPLE_FLG_CLICKED_EVENT_MEMDEF',1)} <u>See example</u> Available only in Freelance Graphics 97. Raised each time Freelance Graphics detects that a given placement block has been clicked.

Syntax

Clicked(Source As PlacementBlock)

Parameters

Source As PlacementBlock

Represents the clicked placement block as a PlacementBlock object.

Usage

Use this event to run a script whether a placement block has been clicked.

Freelance Graphics: PreClose event

{button ,AL(`;H_DOCUMENT_CLASS',0)} <u>See list of classes</u> {button ,AL(`H_EXAMPLE_FLG_CLOSE_EVENT_MEMDEF',1)} <u>See example</u> Available only in Freelance Graphics 97. Raised each time Freelance Graphics receives an instruction to close the document (.PRZ file).

Syntax

PreClose(Source As Document)

Parameters

Source As Document

Represents the document to be closed as a Document object.

Usage

Use this event to run a script when Freelance Graphics receives a command to close a document.

Freelance Graphics: Created event (Document)

{button ,AL(`;H_DOCUMENT_CLASS',0)} <u>See list of classes</u> {button ,AL(`H_EXAMPLE_FLG_CREATED_DOCUMENT_EVENT_MEMDEF',1)} <u>See example</u> Available only in Freelance Graphics 97. Raised each time Freelance Graphics has finished creating a new presentation document (.PRZ file).

Syntax

Created(NewDocument As Document)

Parameters

NewDocument As Document

Represents the newly created presentation as a Document object.

Usage

Use this event to run a script when Freelance Graphics has created a document (presentation file). Note that although Freelance Graphics has created the document, it has not yet been named or saved.

Because a presentation (.PRZ) file inherits scripts from SmartMaster content files (.SMC), the most effective use of the Created event is when it is employed in a SmartMaster content (.SMC) file, it is meaningless in a .PRZ file.

Freelance Graphics: Created event (Page)

{button ,AL(`;H_PAGE_CLASS',0)} <u>See list of classes</u> {button ,AL(`H_EXAMPLE_FLG_CREATED_PAGE_EVENT_MEMDEF',1)} <u>See example</u> Available only in Freelance Graphics 97. Raised each time Freelance Graphics has finished creating a page.

Syntax

Created(Source As Page)

Parameters

Source As Page

Represents the newly created page as a Page object.

Usage

Use this event to run a script when Freelance Graphics has created a page.

Because a presentation (.PRZ) file inherits scripts from SmartMaster content files (.SMC), the most effective use of the Created event is when it is employed in a SmartMaster content (.SMC) file, it is meaningless in a .PRZ file.

Freelance Graphics: DocumentCreated event

{button ,AL(`;H_APPLICATION_CLASS',0)} See list of classes

{button ,AL(`H_EXAMPLE_FLG_DOCUMENTCREATED_EVENT_MEMDEF',1)} <u>See example</u> Available only in Freelance Graphics 97.

Raised each time Freelance Graphics has finished creating a new document (presentation file).

Syntax

DocumentCreated(Source As Application, Pathname As String, NewDocument As Document)

Parameters

Source As Application

Represents the current application as an Application object.

Pathname As String

A string representing the path name of the new document. This parameter is always ignored because the document has not been named or saved yet, and therefore has no pathname.

NewDocument As Document

Represents the newly created document as a Document object.

Usage

Use this event to run a script when Freelacne Graphics has created a document (presentation file). Note that although the document has (presentation file) been created, it has not yet been named or saved.

Freelance Graphics: DocumentOpened event

{button ,AL(`;H_APPLICATION_CLASS',0)} See list of classes {button ,AL(`H_EXAMPLE_FLG_DOCUMENTOPENED_EVENT_MEMDEF',1)} See example Available only in Freelance Graphics 97. Raised each time Freelance Graphics has finished opening an existing document (presentation file).

Syntax

DocumentOpened(Source As Application)

Parameters

Source As Application

Represents the current session of Freelance Graphics as an Application object.

CurrentDocument As Document

Represents the presentaiton file just opened as a Document object.

Usage

Use this event to run a script when Freelance Graphics has opened an existing presentation file.

Freelance Graphics: DocumentOpen event

{button ,AL(`;H_APPLICATION_CLASS',0)} See list of classes {button ,AL(`H_EXAMPLE_FLG_DOCUMENTOPEN_EVENT_MEMDEF',1)} See example Available only in Freelance Graphics 97. Raised each time Freelance Graphics receives an instruction to open an existing document.

Syntax

DocumentOpen(Source As Application, Pathname As String)

Parameters

Source As Application

Represents the current session of Freelance Graphics as an Application object.

Pathname As String

A string representing the full name (including path) of the document about to be opened.

Usage

Use this event to run a script when Freelance Graphics receives a command to open an existing document.

Freelance Graphics: SMCStarted event

{button ,AL(`;H_DOCUMENT_CLASS',0)} See list of classes
{button ,AL(`H_EXAMPLE_FLG_GTSTARTED_EVENT_MEMDEF',1)} See example
Available only in Freelance Graphics 97.
Raised each time Freelance Graphics uses a SmartMaster content topic as the basis for a presentation page.

Syntax

SMCStarted(Source as Document)

Parameters

Source As Document

Represents the active document as a Document object.

Usage

Use this event to run a script when Freelance Graphics receives a command to use a content topic for a presentation. This event is triggered when the user chooses File - New and selects a SmartMaster with content, or when the user switches over from not using a SmartMaster content topic to using a SmartMaster content topic by choosing Presentation - SmartMaster Content - Select a Topic.

Freelance Graphics: Opened event

{button ,AL(`;H_DOCUMENT_CLASS',0)} <u>See list of classes</u> {button ,AL(`H_EXAMPLE_FLG_OPENED_EVENT_MEMDEF',1)} <u>See example</u> Available only in Freelance Graphics 97. Raised each time Freelance Graphics has finished opening an existing presentation file.

Syntax

Open(Source As Document)

Parameters

Source As Document

Represents the just opened presentation file as a Document object.

Usage

Use this event to run a script when Freelance Graphics has opened a presentation.

Freelance Graphics: PageCreated event

{button ,AL(`;H_PAGE_CLASS',0)} <u>See list of classes</u> {button ,AL(`H_EXAMPLE_FLG_PAGECREATED_EVENT_MEMDEF',1)} <u>See example</u> Available only in Freelance Graphics 97. Raised each time Freelance Graphics has finished creating a page.

Syntax

PageCreated(Source As Page)

Parameters

Source As page

Represents the newly created page as a Page object.

Usage

Use this event to run a script when Freelance Graphics has created a page.

Freelance Graphics: Quit event

{button ,AL(`;H_APPLICATION_CLASS',0)} <u>See list of classes</u> {button ,AL(`H_EXAMPLE_FLG_QUIT_EVENT_MEMDEF',1)} <u>See example</u> Available only in Freelance Graphics 97. Raises each time Freelance Graphics receives an instruction to end the current Freelance G

Raises each time Freelance Graphics receives an instruction to end the current Freelance Graphics application session.

Syntax

Quit(Source As Application)

Parameters

Source As Application

Represents the about to be closed Freelance Graphics session as an Application object.

Usage

Use this event to run a script when Freelance Graphics receives a command to exit, that is, shut down.

Freelance Graphics: SaveAs event

{button ,AL(`;H_DOCUMENT_CLASS',0)} <u>See list of classes</u> {button ,AL(`H_EXAMPLE_FLG_SAVEAS_EVENT_MEMDEF',1)} <u>See example</u> Available only in Freelance Graphics 97. Raised just before Freelance Graphics writes to another file type (such as a .BMP file) or as a presentation (.PRZ) file.

Syntax

SaveAs(Source As Document)

Parameters

Source as Document

Represents the presentation to be saved as a Document object.

Usage

Use this event to run a script when the user chooses File - Save As and saves the presentation as a .PRZ file or as as another file type (such as a .BMP file). The event is raised just before Freelance Graphics actually writes the file.

Freelance Graphics: SavedAs event

{button ,AL(`;H_DOCUMENT_CLASS',0)} See list of classes

{button ,AL(`H_EXAMPLE_FLG_SAVEDAS_EVENT_MEMDEF',1)} See example

Available only in Freelance Graphics 97.

Raised each time Freeelance Graphics has finished saving a presentation as a presentation (.PRZ) file or as another file type.

Syntax

SavedAs(Source As Document)

Parameters

Source As Document

Represents the presentation just saved as a Document object.

Usage

Use this event to run a script when the user chooses File - Save As and saves the presentation as a .PRZ file or as as another file type (such as a .BMP file). The event is raised when Freelance Graphics has finished writing to a file.

Freelance Graphics: Saved event

{button ,AL(`;H_DOCUMENT_CLASS',0)} <u>See list of classes</u> {button ,AL(`H_EXAMPLE_FLG_SAVED_EVENT_MEMDEF',1)} <u>See example</u> Available only in Freelance Graphics 97. Raised when Freelance Graphics has finished saving a presentation (.PRZ) file.

Syntax

Saved(Source As Document)

Parameters

Source As Document

Represents the presentation that has just been saved as a Document object.

Usage

Use this event to run a script when the user chooses File - Save. The event is raised after Freelance Graphics has finished writing the file.
Freelance Graphics: Save event

{button ,AL(`;H_DOCUMENT_CLASS',0)} <u>See list of classes</u> {button ,AL(`H_EXAMPLE_FLG_SAVE_EVENT_MEMDEF',1)} <u>See example</u> Available only in Freelance Graphics 97.

Raised each time Freelance Graphics receives an instruction to save a presentation and just before Freelance Graphics actually writes to the file.

Syntax

Save(Source As Document)

Parameters

Source As Document

Represents the presentation about to be saved as a Document object.

Usage

Use this event to run a script when the user chooses File - Save. The event is raised just before Freelance Graphics writes to the file.

Developing SmartSuite Applications

Developing SmartSuite Applications Using LotusScript is available in the SmartSuite CD package as an online book. To install *Developing SmartSuite Applications Using LotusScript*, see the SmartSuite installation instructions.

To order a printed version of *Developing SmartSuite Applications Using LotusScript* and other LotusScript user assistance in the SmartSuite 97 Application Developer's Documentation Set, complete the <u>order form</u> and return it to Lotus.

Order Form for the SmartSuite 97 Application Developer's Documentation Set

The SmartSuite Application Developer's Documentation Set provides the following LotusScript programming manuals:

• Developing SmartSuite Applications Using LotusScript is a comprehensive introduction to developing applications for SmartSuite 97. It offers chapters on key programming concepts, using LotusScript programming tools, programming individual SmartSuite products, developing cross-product scripts, and integrating scripts with Notes.

Note These manuals are available only in English.

- LotusScript Language Reference provides a comprehensive summary of conventions and basic commands for the LotusScript language. LotusScript Language Reference provides the foundation for programming any product that supports the LotusScript programming language.
- *The LotusScript Programmer's Guide* describes the basic building blocks for LotusScript applications and provides many working examples.

These books are available in the CD-ROM version of your SmartSuite package as Online Books and available for viewing on Lotus' World Wide Web site (http://www.lotus.com). Should you want to order printed versions, simply fill out this form and send it to the appropriate office. Please send me (1) free copy of the SmartSuite 97 Application Developer's Documentation Set. I understand that I must pay a shipping and handling fee. Please allow 4 - 6 weeks for delivery. Name

Company

If paying by check, please mail this card with your check, payable to *Lotus Development Corporation*, in a sealed envelope.

See the Lotus World Wide Web home page or the back cover of *Getting the Most Out of LotusScript in SmartSuite 97* for details on mailing addresses and shipping and handling charges.

LotusScript Documentation as Online Books

If you have purchased the CD-ROM version SmartSuite 97, you can use SmartSuite Install to install the following Online Books about LotusScript: • Getting the Most Out of LotusScript in SmartSuite 97

- Developing SmartSuite Applications Using LotusScript
- LotusScript Language Reference
- LotusScript Programmer's Guide

For more information about installing Online Books, see your SmartSuite 97 installation documentation.

LotusScript Documentation on the Web

You can view updated versions of LotusScript documentation or download updated sample applications or Help files from the LotusScript home page.

If you have configured Windows to launch your Web browser automatically when you click a URL on your desktop, you can click the following button to go to the LotusScript home page. Click to access the LotusScript home page

If you have not configured Windows to launch your Web browser automatically, enter the following URL in the location field in your browser and press ENTER:

http://www.lotus.com/smartsuite/sslotusscript.htm

Overview: Designing SmartSuite Applications

LotusScript provides a variety of tools and services to support you in developing applications for SmartSuite. Getting productive in a new programming environment often involves understanding how all the pieces work together -- the tools, the language conventions, the object dependencies, and so on. Understanding how to approach the problem and where to enter your script code is half the challenge in learning.

Choosing a place to begin

Lotus Notes, 1-2-3, Approach, Freelance Graphics, and Word Pro all use the same underlying LotusScript language. Each product implements LotusObjects on top of the LotusScript language. To determine which product best supports the goals for your script application, consider using each of the SmartSuite products and reviewing its features. Read *Developing SmartSuite Applications Using LotusScript* for overviews of what each product can bring to your programming effort. Implement a couple of simple procedures in each of the products to get a feel for its features and objects. In the long run, you'll be better able to determine which product provides strengths where you need them most and how you can develop cross-product applications that take advantage of the strengths of each product.

Working the basics

LotusScript applications share the following common features.

- You need a Lotus product to run script applications.
- You need a Lotus product to store scripts in a product document such as a 1-2-3 workbook or Word Pro document.
- You need to run the Lotus Integrated Development Environment (IDE) to edit and debug scripts stored in a product document.
- You need to open an IDE window for each product document containing scripts that you want to modify.

To write a basic script application, therefore, you must run a Lotus product and load a document in that product. You can then write scripts for the product objects that you have created in your product.

Writing scripts in the Integrated Development Environment (IDE)

Your primary tool for developing script applications is the Lotus Integrated Development Environment (IDE). Beyond providing the basic tools such as an editor, a debugger, a browser, and a dialog editor, the IDE provides a high degree of integration with each Lotus product. It is easy to move between tasks that you perform in a product and those that you perform in the IDE.

Writing global scripts

Global scripts make declarations, options, and procedures available to all scripts in your document. For example, to write global scripts for a 1-2-3 document named LSAPP2.123, you must first run 1-2-3, load the document LSAPP2.123, and then open an IDE window for that document. Choose Edit - Scripts & Macros - Show Script Editor in the 1-2-3 menu to activate an IDE window for your current document.

The IDE lists objects that you can script in the Object list and scripts for each of those objects in the Script list. You can add statements to predefined scripts in (Globals) such as (Options), (Declarations), Initialize, or Terminate or you can create your own named procedures. You do not need to modify predefined scripts to write a basic script application.

The following illustration shows how to select a particular script for (Globals).

Click any item in the following list to learn more about it.

1 Product document

🤙 h

Initialize and Terminate subs

Writing scripts for product objects

You can also write scripts for product objects in your document. As with (Globals), you can add statements in the predefined scripts for an object or create new procedures for that object. Unlike scripts that you write in (Globals), the declarations, options statements, and procedures that you write for a product object are not generally available to scripts attached to a different product object.

The predefined scripts for product objects include object event procedures. Script statements in an object event procedure are executed when an object such as a button receives a particular event in your product such as its being clicked, double-clicked, or moved. For example, if you have added a button named Button 5 to the 1-2-3 document LSAPP2.123 and you want it to run some script when you click it, you must add script statements to the Click procedure for Button 5. To select this event procedure, choose the Button 5 object in the IDE Object list and choose Click in the Script list.

The following illustration shows how to select a predefined or user-defined script for a 1-2-3 product object named Button 5.

(4) (1) Event procedures User-defined procedures J Initialize and Terminate subs 2 (Options) scripts 3 (Declarations) scripts [LSAPP2] <u>F</u>ile <u>E</u>dit <u>V</u>iew <u>C</u>reate <u>Range</u> Sheet Window. <u>H</u>elp P @ C:K3 Data \ Queries \ Controls \ С А в С D F F Product 1 Button 5 object 2 3 Scripts for "LSAPP2" 4 Object Script Help <u>File Edit View Create</u> 5 scripts Object: Script: 6 Button 5 • UserDefinedSub $(\mathbf{1})$ 7 2 (Options) 8 Sub UserDefinedSub 3 (Declarations) 9 Dim AppName As String AppName = "WeeklyBud Click (4) 10 Call AppSetup1 (AppNam Deselected 11 End Sub Initialize <mark>(5</mark>) 12 Methodinvoked 13 Namechange. 14 15 16 17 18 € 19 Errors: 20 21

Click any item in the following list to learn more about it.

Working with external script files

In many cases, the one-application-per-document approach is sufficient for working with objects and data in isolated documents. To develop more sophisticated applications that reuse important scripts or use multiple products, you should consider using the following types of external script files:

LotusScript Script (LSS) files LotusScript Object (LSO) files LotusScript Extension (LSX) files OLE Custom Control (OCX) files Dynamic-link Library (DLL) files

Dynamic-link Library (DLL) files

If you have developed useful functions in C and compiled them in a Dynamic-link Library (DLL), you can call them from your LotusScript application. For example, the following procedure declares and calls a LotusScript function named SendDLL corresponding to a C function named _SendExportedRoutine in the DLL file named MYEXPORTS.DLL.

Declare Function SendDLL Lib _ "C:\LOTUS\ADDINS\MYEXPORTS.DLL" _ Alias "_SendExportedRoutine" (i1 As Long, i2 As Long) SendDLL(5, 10)

For more information on using Dynamic-link Libraries, see LotusScript Language Reference.

(Declarations) scripts in (Globals)

The (Declarations) script is designed to contain the following statements:

- · Dim statements for variables that you want to be available to all scripts in your document
- Public, Private, Type, Class, and Declare Lib statements (external C calls)
- Const statements for those constants that you want to be available to all scripts in your document and are not needed for Use or UseLSX statements in (Options)

By default the (Declarations) script is initially empty.

If you enter Type, Class, or Declare Lib statements in any other script in (Globals), the IDE moves them to (Declarations) automatically. If you enter Dim, Public, Private, or Const statements outside the scope of a procedure in another script, the IDE moves them to (Declarations) automatically. Const statements in (Options) are the exception to this rule.

Initialize and Terminate subs in (Globals)

Initialize script

Use the Initialize sub in (Globals) to initialize variables that you have declared in (Declarations). The Initialize sub executes before any of these variables are accessed and before any other scripts in (Globals) are executed. By default, the Initialize script is empty.

Terminate script

Use the Terminate sub in (Globals) to clean up variables that you have declared in (Declarations) when you close your document or when you modify a script and execute it again. For example, you might use an Open statement to open a file containing data in Initialize and use a Close statement in Terminate to close it. By default, the Terminate script is empty.

(Options) scripts in (Globals)

The (Options) script in (Globals) is designed to contain these the following statements:

· Option statements

Note (Options) contains the statement Option Public by default. This makes Const, Dim, Type, Class, Sub, Function, and Property statements public by default. You can use the Public form of these statements to make them public explicitly or the Private form to make them unavailable to other scripts outside (Globals).

- Def*type* statements
- · Use and UseLSX statements
- · Const statements needed for Use and UseLSX statements

If you enter any of these statements, except for Const, in any other script in (Globals), the IDE automatically moves them to (Options).

Option and Def*type* statements that you enter in (Options) apply only to scripts for the current object. To make certain that an option is applied consistently throughout your document, enter the appropriate statement in the (Options) script for every object for which you are writing scripts.

User-defined procedures in (Globals)

While you are working in (Globals), you can add procedures to make them available throughout your document. There are three ways to add procedures to (Globals) in the IDE:

- Using the IDE menu: Choose Create New Sub or Create New Function in the IDE menu to create new subs and functions in (Globals). The IDE automatically adds the name of the new procedure to the Script list.
- *Entering statements*: Enter a Sub, Function, or Property statement anywhere in (Globals) except within a class. The IDE automatically adds the name of the new procedure to the Script list for (Globals).
- Importing procedures from a file: Use File Import Script in the IDE menu to import scripts when you are working in (Globals). These imported scripts will be available to all scripts in your document. The IDE automatically adds the name of any new procedures contained in the imported script to the Script list.

LotusScript User Assistance for SmartSuite 97

To help you learn how to develop LotusScript applications for SmartSuite 97, Lotus provides a complete library of user assistance.

Getting the Most Out of LotusScript in SmartSuite 97

This publication explains how SmartSuite 97 products use the LotusScript programming language and how your business can take advantage of LotusScript in developing applications for SmartSuite.

Getting the Most Out of LotusScript in SmartSuite 97 is available in hardcopy, Adobe Acrobat, or HTML formats in your SmartSuite 97 package, in the <u>SmartSuite Application Developer's</u> <u>Documentation Set</u>, or on the <u>Worldwide Web</u>.

Developing SmartSuite Applications Using LotusScript

This publication provides comprehensive information on key concepts and techniques for developing LotusScript applications. *Developing SmartSuite Applications Using LotusScript* focuses on programming tools, cross-application programming, Notes integration, and product-specific application development.

Developing SmartSuite Applications Using LotusScript is available in hardcopy, Adobe Acrobat, or HTML formats in your SmartSuite 97 package, in the <u>SmartSuite Application Developer's</u> <u>Documentation Set</u>, or on the <u>Worldwide Web</u>.

LotusScript Language Reference

This publication provides a comprehensive summary of conventions and basic commands for the LotusScript language. *LotusScript Language Reference* provides the foundation for programming any product that supports the LotusScript programming language.

LotusScript Language Reference is available in hardcopy, Adobe Acrobat, Help, or HTML formats in your SmartSuite 97 package, in the <u>SmartSuite Application Developer's</u> <u>Documentation Set</u>, or on the <u>Worldwide Web</u>.

LotusScript Programmer's Guide

This publication is a general introduction to LotusScript that describes basic building blocks in the language and explains how to use them to create powerful applications.

LotusScript Programmer's Guide is available in hardcopy, Adobe Acrobat, or HTML formats in your SmartSuite 97 package, in the <u>SmartSuite Application Developer's Documentation Set</u>, or on the <u>Worldwide Web</u>.

Class Reference Help and Frequently-asked Questions

Each product provides comprehensive Help on product classes, frequently-asked questions about programming, and code examples. All this is delivered in an innovative Help system designed to enhance your work as a programmer.

Class reference Help and frequently-asked questions are available in Help format in your SmartSuite package or in HTML format on the <u>Worldwide Web</u>.

Example code and sample applications

Most products also provide working code to illustrate important programming techniques. You can reuse and modify this code as you develop your own applications.

Example code is available in the SmartSuite package and on the <u>Worldwide Web</u>.

LotusScript Object (LSO) files

LotusScript Object (LSO) files contain public definitions that you can use in your script applications. If you develop a library of commonly-used declarations or procedures that you want to reuse across multiple script applications, you can collect them in a product document and use the File - Export Globals as LSO menu command to create a compiled LotusScript Object file. If this file were named WKREPORT.LSO, you would make these public definitions available to your script application by entering the following statement in the appropriate (Options) script:

Use "C:\LOTUS\ADDINS\WKREPORT.LSO"

For more information on using LotusScript Object files, see LotusScript Language Reference.

LotusScript Script (LSS) files

LotusScript Script (LSS) files are text files that contain LotusScript statements. You can create LSS files in any text editor. Use the %Include directive anywhere in a script to reference the contents of an LSS file. For example, to include the contents of a LotusScript Script file named STDSETUP.LSS in your application, enter the following statement: %Include "C:\MYSCRIPTS\STDSETUP.LSS"

By default, LotusScript assumes that the LotusScript Script files that you reference have an LSS file extension. You can actually use any extension for your text file or no extension at all. For more information on using LotusScript Script files, see *LotusScript Language Reference*.

LotusScript Extension (LSX) files

LotusScript Extension (LSX) files are Dynamic-link Libraries (DLLs) that contain public class definitions. LSX files are developed using with the Lotus LSX Toolkit. To obtain a version of the LSX Toolkit for your operating system, connect to the Lotus home page on the WorldWide Web. Lotus ships LSX files for Notes and Approach; other LSX files are being developed for SmartSuite products by Lotus and by third-party developers. These extension files expand the range of classes that you can use in your LotusScript applications.

Tip You can enter a UseLSX statement in any script; the IDE automatically moves it to (Options).

Loading and using class definitions in LSX files

There are two ways to load and use the public class definitions in an LSX file.

• If the LSX file that you want to load is not registered in the Windows Registry, you must refer to the LSX file directly in your UseLSX statement.

UseLSX "C:\MYSCRIPTS\LSX4DB2.DLL"

• If an LSX is registered and you want to reference a class definition directly, you can enter the name of the class definition.

UseLSX "ObjectName"

In this example, LotusScript searches all entries under "LotusScriptExtensions" in the Windows Registry for the specified class definition and loads that definition.

Note If the LSX file you want to load is registered in the Windows Registry, you can reference its Registry name and have Windows provide the appropriate DLL name and file path. SmartSuite 97 registers an LSX file that contains Notes public class definitions. To use these Notes class definitions in your cross-product script applications, enter the following statement:

UseLSX "*Notes"

Viewing class definitions

Once you have run a script containing a UseLSX statement and loaded an LSX file, you can browse its class definitions in the IDE Browser panel.

For more information on using LotusScript Extension files, see LotusScript Language Reference.

(Declaration) scripts in object scripts

The (Declarations) script for an object is designed to contain the following statements:

- Dim statements for variables that you want to be available to all scripts for the current object
- Const statements for those constants that you want to be available to all scripts for the current object and that are not needed for Use or UseLSX statements in (Options)

By default the (Declarations) script is initially empty.

Event procedures in object scripts

If you are writing a script for an object, the Script list displays default event procedures for the selected object. In the IDE you cannot create new event procedures for an existing product object because valid events for that object are defined by the product.

Initialize and Terminate subs in object scripts

Initialize sub

Use the Initialize sub to set up variables declared in the object's (Declarations) script. The Initialize sub for an object executes before any of its event procedures. By default, the Initialize script is empty.

Note Scripts for controls created in the Lotus Dialog Editor do not have Initialize subs.

Terminate sub

Use the Terminate sub to clean up variables that you have declared in the object's (Declarations) script. By default the Terminate script is empty.

Note Scripts for controls created in the Lotus Dialog Editor do not have Terminate subs.

(Options) scripts in object scripts

The (Options) script for an object is designed to contain these the following statements:

- Option statements
- Def*type* statements
- Use and UseLSX statements
- Const statements needed for Use and UseLSX statements

User-defined procedures in object scripts

You can create other named subs, functions, and properties for objects in addition to the predefined scripts or event procedures. Because these procedures are not in (Globals), they can be called only from other scripts for the object.

There are three ways to create object scripts in the IDE:

- Using the IDE menu: Use Create New Sub and Create New Function to create new subs and functions for an object. The IDE automatically adds the name of the new procedure to the Script list for that object.
- *Entering statements*: Enter a Sub, Function, or Property statement anywhere in a script for the current object. The IDE automatically adds the name of the new procedure to the Script list for that object.
- *Importing procedures from a file*: Use File Import Script when you are working with object scripts to import scripts for that object. The IDE automatically adds the name of any new procedures contained in the imported script to the Script list.

OLE Custom Control (OCX) files

OLE Custom Controls extend the number of objects that you can script in Lotus products. For example, the Lotus dialog controls listed under product classes in the IDE Browser panel are OCX controls that you can add to the Lotus Dialog Editor.

Once you have added an OCX control to your product, you can script its properties, methods, and events in the IDE Script Editor.

The following illustration shows how the properties, methods, and events of an Lotus CommandButton OCX named Command4 are available to you in the IDE.

😻 Dialogs for "LSAPP2"					
<u>F</u> ile <u>E</u> dit ⊻iew <u>C</u> reate <u>D</u> ialog	Help				
Dialog1

Sub Click(Source As Lotusco ' Closes the main dialog ' and runs the main	(Options) (Declarations) Click				
Contemport script.	Gotfocus Lostfocus				

Product Document

To edit scripts in the IDE or to execute them in one or more products, you must create or use a document in your product that contains the scripts. Lotus products supporting LotusScript use the following document extensions:

Lotus Product	Document extension(s)		
1-2-3	123		
Approach	APR		
Freelance Graphics	SMC		
Notes	NSF		
Word Pro	LWP		

Using LotusScript Examples

Code examples provide working models for the scripts that you write. Whether the example is listed in a Help example or available as a product document on disk, you can copy statements or entire scripts from the examples and use them in your own script applications.

There are three types of LotusScript examples, each designed to illustrate a different aspect of the LotusScript language or the classes available for each SmartSuite product.

Examples in reference Help

Most examples appear in reference Help for the LotusScript language and for product classes. These brief examples focus on individual elements in the language or members of a product class. They illustrate how to use correct syntax for a working example, how to enter appropriate values for parameters, and how dependencies between elements operate.

Note Although you can copy examples from reference Help and paste them into your scripts, they are not designed primarily to be self-contained. Sometimes there are dependencies between a piece of example code and the larger sample application from which it is derived.

Examples in Frequently-asked Questions (FAQs) Help

Frequently-asked questions (FAQs) illustrate how to complete common programming tasks using LotusScript. Examples in FAQs not only illustrate how individual statements work, but they also illustrate how these statements form a complete application or procedure. Most examples in FAQs are designed to be self-sufficient; you can copy one or more procedures from Help, paste them into your own scripts in the Script Editor, and execute them.

Note When there are dependencies in an example that would require you to modify the example to make it run, these dependencies are documented in the Help topic or at the beginning of the first script in the example.

Sample applications

The *Developing SmartSuite Applications Using LotusScript* book includes numerous sample applications for SmartSuite and for individual products. These examples are designed to illustrate more sophisticated tasks for an individual product or tasks that utilize more than one product. They illustrate how to develop script applications that take advantage of embedded OLE objects, OLE automation, Notes, Visual Basic, the Worldwide Web, and custom Dynamic-link libraries (DLLs). Lotus develops new sample applications for SmartSuite on an ongoing basis; these new samples and updated versions of the ones in *Developing SmartSuite Applications Using LotusScript* are available on the <u>Worldwide Web</u>.

To copy scripts from these sample applications and paste them into your own script applications, you must first open the sample application document and then display its scripts by opening the IDE window for that document.

Note All sample applications in *Developing SmartSuite Applications Using LotusScript* are designed to run without modification.

Using LotusScript Help

The design for LotusScript Help supports three of the most frequent activities that you perform as a programmer:

- Searching for objects and elements to use in your scripts
- Writing scripts
- Debugging scripts

LotusScript Help uses different types of windows to display different types of information, so it is important to know what each type of window contains and how to navigate between them.

Using Help to search for objects and elements

There are areas in Help designed to help you search for objects and language elements to use in your scripts:

LotusScript Help Contents

You can use Contents in Help to examine the overall structure of Help and to browse for Help topics relevant to your current script.

Contents Index Find
Click a topic, and then click Display. Or click another tab, such as Index.

LotusScript Index

Indexes are one of the most popular ways that programmers search for information. Topics in LotusScript Help are indexed alphabetically so you can enter key phrases or keywords and navigate to the corresponding Help topics.

Contents Index Find
1 <u>Type</u> the first few letters of the word you're looking for.
2 <u>Click the index entry you want, and then click Display.</u>
2 Click the index entry you want, and then click Display. ActionBarVisible property (LotusScript) ActiveDocument property (LotusScript) ActiveDocWindow property (LotusScript) ActiveOcWindow property (LotusScript) ActiveView property (LotusScript)

LotusScript A - Z lists

LotusScript Help for each product provides A - Z lists of its classes, properties, methods, and events, including a comprehensive list of all the elements in the product.

? Approach	Help		٦×		
Help <u>T</u> opics	<u>P</u> rint	Go <u>B</u> ack			
Approach LotusScript A-Z					
A B C D N O P Q	E F G H R S T U	I J K L V W X Y	M Z

IDE Browser Help

The Browser panel in the Integrated Development Environment (IDE) displays lists of LotusScript language elements and classes for products. You can expand and collapse entries in the Browser to view the associated properties, methods, and events for objects.

Browser	Breakpoints	Output		
Category:	Lotus Approach:	Classes		-
APPLICA	TION			
Prope	rties			
📗 🕨 Metho	ods			
Events				
🕨 APPLICA	TIONWINDOW			
BACKGR	IOUND			
BASECOLLECTION				
🕪 BODYPA	NEL			
🕪 BORDEF	3			

Highlight an element in the Browser panel and press F1 (HELP) to get context-sensitive Help on that element.

Using Help to write scripts

Help focuses on objects. As you are writing scripts, you explore the relationships between product classes and the behaviors of objects in that product.

Types of Help windows

To support this exploration, Help separates information about classes into four types of windows:

- Class definition windows define what a class does in a product and how it works in the product's containment hierarchy. The class definition topic for the 1-2-3 Range object describes what ranges do in 1-2-3, how they are contained by larger objects, and how they contain smaller objects.
- Class member list windows list all the properties, methods, and events that are members of a particular class.
- · Class member windows focus on particular properties, methods, or events.
- Example windows contain one or more scripts for a particular property, method, or event. You can copy and paste script statements from these example windows into the IDE Script Editor.

Displaying Help windows

To display different types of LotusScript Help windows, use buttons in Help topics and in the Help window that are labeled by the type of Help window. The following illustration shows how to use buttons to display class member, class member list, and example windows in Help.

The following illustration shows how to display class definition and class member list windows in Help.

Help for editing and debugging scripts

You can also get context-sensitive Help about keywords and messages when you are editing or debugging your scripts in the IDE.

Context-sensitive Help in the Script Editor and Script Debugger

If you need help on a keyword while you are writing or debugging a script in the Script Editor and Script Debugger, place the insertion point on the keyword and press F1 (HELP) to get context-sensitive Help on that keyword.

Context-sensitive Help on messages

You can also get context-sensitive Help on two types of messages in the IDE. In the Script Editor, you can get context-sensitive Help on syntax errors. Navigate to the statement that caused the error and press F1 (HELP). When you are debugging your scripts and the IDE reports a run-time error, press F1 (HELP) to display information about that error and suggestions about fixing it.
