

## AriTech INI File Editor Help

AriTech INI File Editor is a simple application that can manipulate (create or edit) .ini file easily. I know that .ini file is just for backward compatibility in Windows 95/98/NT or above but until now many applications still use this kind of file to store their application configuration. OK, back to program again.

AriTech INI File Editor has a simple interface. The editor is easy to use and easy to understand. It content two panes. The first pane is the section pane and the second pane is for keys and value.

In first pane you can click right mouse button to display popup menu to manipulate current highlighted section. The menu will contains add new section, delete section and rename section.

In second or right pane you can click right mouse button to display popup menu to manipulate current highlighted key and value. The menu will contains add new key, delete key, rename key and modify value.

New in this version (v1.90):

- Still **\*\*FREE\*\*** software, but please give me a donation :-)
- Add special menu that can open win.ini and system.ini

OK, that's all and enjoy this new updated version of AriTech INI File Editor.

Hello world.... I need a notebook computer. Can you give me one? I need it for my programming activities. Many thanks to people that have been downloading and using AriTech INI File Editor. Please send me comments, suggestions or critics so I know where my software goes. Your donation can help me to produce better software.
