Soft Lite ScriptWorx 4.0
- Help On: subdomains.cgi

Requires:
- Perl 5 or higher

Purpose:
To enabled 'subdomains' at a particular URL, ie: http://softlite.net.   You could use this script to add a www. or software. prefix to your domain name.

System Guidelines:
UNIX: Upload the file to your root directory, and change its chmod permissions to 777.

Example Code:

```
%domains = (
        'www.softlite.net'              => '/',
        'scriptworx.softlite.net'       => 'products/scriptworx/
);
```

By entering the subdomain **and** domain name in column one, and then changing the directory path in column two, to the directory on your site which is the real location of content for that sub-domain.

Last Update: March 2000 - SoftLite International.
