

Matrox MultiDesk

Use Matrox multi-desktop software to simulate having more than one Windows desktop. This may make it easier to manage many programs at a time.

This software can simulate having more than one Windows desktop by changing what programs you see and by changing the appearance of your Windows workspace. When you switch desktops, programs are shown or hidden depending on what desktops they're associated with. Hidden programs don't appear anywhere on your current Windows desktop and they don't appear on your Windows taskbar. To show a hidden program, you can use multi-desktop controls to switch to the desktop that the program is associated with.

With multi-desktop controls, you can define new desktops, change settings for existing desktops, and change multi-desktop settings for each program that's currently running. You can access multi-desktop controls through the taskbar menu, the program window, or keyboard shortcuts. You can also access multi-desktop controls through the Matrox QuickDesk menu on your Windows taskbar.

To learn more on how multi-desktop controls work, explore the various commands in the taskbar menu and explore the program window.
