

Unit Conversion Utility

Overview

This utility was written for my own use, as I couldn't find anything on the Internet that would do the job I needed. Many of the "converters" out there didn't perform the conversions I needed, or to the degree of accuracy I desired.

This utility has been developed using Visual C++ with MFC technology. It is a true 32-bit application, designed for 32-bit versions of Microsoft Windows.

The application will only run on 32-bit operating systems (Windows 98 through Windows XP). *It will not run on Windows 3.x or Windows 95.*

Installation Notes

This application is installed and uninstalled using the *Microsoft Installer* utility. This is shipped as part of Windows 2000, and also with many other applications (for example Office 2000, McAfee 4.5 and Visio 2000). The Microsoft Installer can be downloaded from the Microsoft website, and is compatible with Windows 95, Windows 98 and Windows NT. Alternatively it may be downloaded from my web site.

Two versions of the application may be available for download from my site. One is the complete version, which is installed using the Microsoft Installer. The other is the executable object. You only need to download the full version once - you will be able to install updated versions simply by downloading the ZIP file and extracting and replacing the old files. If there is only one version on the site then you are already using the latest version.

Full online help is available, either from the Start menu or from within the application.

Please let me know what you think of the application - it's not Earth-shattering by any stretch of the imagination, but if you are working with conversions all day then it is a real time-saver. Besides, I'm always on the lookout for suggestions for improving the product!

If you use the application, and find it useful, then just drop me an email to let me know.

Support

Full support information is contained within the help file. This can be viewed either from within the application or from the Start menu.
