

## Running a Slide Show

The slide show option allows you to automatically view every page and movie in a project. There are several options to this function including length of delay between pages and looping the slide show. This feature will also be available in the ProViewer.

The project file must be saved before you can use this command.

Choose **Run Slide Show** from the **File** menu. The slide show options dialog will appear.

Select the options you want and press run. That's it. The slide show will run through until the end and then return you to the project.

During the slide show you can press the space bar to pause on a picture (press it again to resume), and you can press "Q" at any time to quit the slide show.
