elcome to FontLINK
another great PrePress tool from the
makers of the new
ColorGATE Rip Software

Font Link is the affordable easy answer to those irritating font problems you might encounter when using RIP software to print EPS files.   the problem with these software products is the connection of fonts to the eps document. FontLINK will determine which fonts are needed, and create a new EPS with those fonts included! This file is then printable with all postscript compatible rips on the market.

Witness the next session where we will show you how easy it is to take a random EPS file, see which fonts it needs, and find them.

The FontLINK application:

his is how fontlink apears on your desktop.
To quickly start the program with the file you want to link just drag the file on top of the fontlink program icon. The installer has all ready made two folders on your desktop a to be converted folder and   FontLINK Converted. You can however change these folders any time with the set command button.

Before you start please add all font folders on you own disk. We have defaulted to the system folder and Font folder. But if you have modified your path please add or change this in the setup menu and dialog. If you have lots of fonts then it will take some time to start the application because its reading your font files and sorting them for use.

Please use setup from the menu:

ou can also make a resifdent font linsting for the fonts your rip supports.
