Chapter 14 Spellchecking Your Work

This chapter introduces the spell checker–a new productivity tool built into GoLive CyberStudio.

General

In addition to its built-in link parsing and syntax checking functions, the new release of GoLive CyberStudio features a built-in spellchecking tool to help ensure that your text content is 100% error-free when you launch your site on the Web.

The spellchecker works much like the same tool in word processors, letting the user change and skip misspellings. Unlike other spellchecking tools, however, GoLive CyberStudio has the ability to spell check an entire project.

Spellchecking Your Work with GoLive CyberStudio
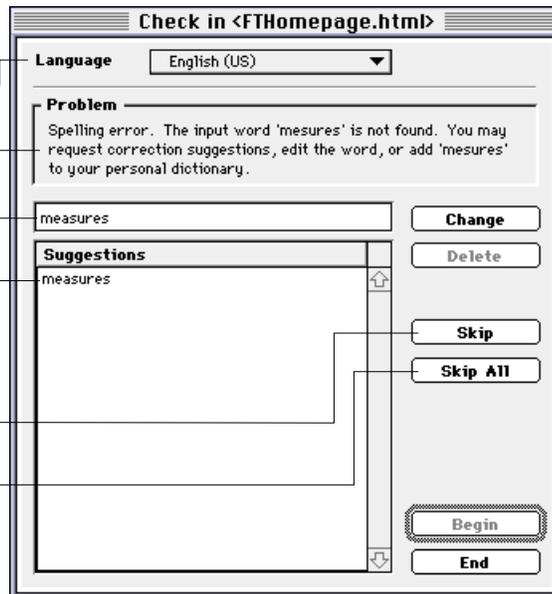

Select a language from this popup menu.

This pane displays a description of the spelling problem found.

Use this text box to edit the misspelled word, then click the Change button.

This list box displays the corrections suggested by the program. Click the Change button to accept the first suggestion, or select one from the list box.

Use this button to accept a single occurrence of a questionable word.

Use this button to accept all occurrences of a questionable word for the current session.

Language   English (US)

Problem
Spelling error. The input word 'mesures' is not found. You may request correction suggestions, edit the word, or add 'mesures' to your personal dictionary.

measures   **Change**

Suggestions   Delete
measures

                    Skip

                    Skip All

                    Begin

                    End

Using the Spellchecking Tool

Based on a combined dictionary in the *Spelling DBs* subfolder of the GoLive CyberStudio program folder, the built-in spellchecking tool currently supports three sets of English spelling rules (see Step 6 below).

To spell check your document, proceed as follows:

To launch the spellchecking tool, choose the *Spellchecking…* command from the *Edit* menu from within one of the following windows:

- the document window in *Layout* view
- the document window in *Source* view
- the *Project* window

Please note: GoLive CyberStudio will not display any document windows in the background while you are spellchecking an entire project.

6 Select a set of spelling rules from the *Language* popup menu.

7 Click the Begin button to start running the spellchecker.

8 The program will display the first questionable word now, accompanied by a description of the problem and suggested corrections.

9 If you are satisfied with the first suggestion, click the Change button to have GoLive CyberStudio change your text accordingly. If not, select another suggestion from the list box or edit the questionable word before clicking the Change button.

Alternatively, you have three options for accepting questioned words:

- Click the Skip button to accept a single occurrence of the questioned word. When finding the next occurrence of that word, the program will prompt you again to correct it.
- Click the Skip All button to accept the questioned word for the current session. Any further occurrences of that word will be ignored.

10 The message *No more errors found* indicates that you are done spellchecking.

11 Click the End button to close the spellchecker window.
