

ZTerm

What it is

ZTerm is an award-winning shareware telecommunications program that you can use to dial bulletin boards or other Macs. ZTerm gives you a Phone List file that can hold many Dialing setups. Each setup contains the phone number, port settings, and many other settings. Each dial setup appears in the Dial menu to allow easy connection to all of the services you connect to.

What you need

A Mac 512Ke or later and System 4.1 or later.

Installation summary

Open the SOFTWARE SAMPLER folder on the CD-ROM. Open the ZTerm folder; if you like, drag the ZTerm folder to your hard drive.

To use ZTerm, double-click its icon.

The manual

There are two manuals: a Beginner's Guide (double-click to open; use the Contents menu to turn pages), and the original ZTerm manual. This latter comes in the form of either a MacWrite or a Word document (in the ZTerm folder). If you own Word or MacWrite, double-click the document. If not, launch your word processor; then choose Open from the File menu to import the manual.
