QuickPop

What it is

QuickPop does just two things, but was designed to do them very well. The first is to allow you to assign "Hotkeys" to up to 30 Apple Menu Items, control panels, applications, FKEYs, documents, or monitor depth (colors) or speaker volume settings. When the Hotkeys are pressed from within most any program, the selected item will instantly launch.

The second is to make a menu pop up anywhere on the screen when you hold down a particular key and click. From this pop-up menu you can launch any of those same kinds of files (documents, applications, control panels, etc.).

What you need

System 6.0.7 or later.

Installation summary

Open the SOFTWARE SAMPLER folder on the CD-ROM. Open the QuickPop folder. Drag the QuickPop icon onto your System Folder icon. Click OK. Restart your Mac.

The manual

QuickPop's user guide is a SimpleText document inside the QuickPop folder.
