

Control Strip Clock 1.0.0

by

Jeremy Kezer

What is it?

Control Strip Clock is a Control Strip module that displays the current time. It requires Apple's Control Strip software to work.

I developed CS Clock while familiarizing myself the Control Strip software. I found it useful, and thought others might as well. So I polished it up and here it is!

Installing Control Strip Clock

To install CS Clock, it must be placed in the Control Strip folder inside your system folder. Unfortunately, the Apple system software isn't smart enough to automatically realize that it should go there, so you must drag it to this folder manually.

- 1) Open your System folder.
- 2) Copy the Control Strip Clock file to the Control Strip Folder in your System folder.
- 3) Restart your computer.

Configuring Control Strip Clock

When the Control Strip Clock first appears, it will look like the display below.

here are several user-configurable options, controlled by the popup menu associated with this module. To make the menu appear, click down anywhere on the clock portion of the Control Strip, and it will pop up.

isplay seconds

If selected, the seconds will be displayed. Turning this off will make the display smaller.

Small font

If selected, the clock will be displayed in Geneva. The default is Chicago, which is easier to read, but takes more space in the Control Strip.

Display AM/PM

If selected, either AM or PM will be displayed. Turning this off will make the display smaller.

Freeware

This Control Strip module is free! If you like it and use it, I'd love it if you'd drop me a line. Also feel free to send along any suggestions for other Control Strip modules.
