**Personal Folder File**

You can also designate a personal folder file as the delivery location for your incoming mail. When you add a personal folder file to your profile, it appears in the folder list with the default name "Personal Folders."

You can work with personal folder files as you would any other file. You can save, copy, and move them to other locations on your hard drive, to a floppy disk, or to a file server. Personal folder files have a .pst extension.

**Offline Folder File**

The file on your computer's hard disk that contains your offline folders. An offline folder file can be created automatically when you install the Microsoft Exchange Client, or you can create one when you first make a folder available offline. The offline folder file has an .ost extension.
