

Flood Bots Help

This utility is used to load clones onto IRC servers, which will perform various CTCP/text floods, then disconnect. Before you run this program, consider two things. First, CTCP floods are not as effective as they were a couple of years ago (they used to be deadly, now everyone except newbies are protected from them). Second, most IRC servers run connection monitor bots and may quickly kill (i.e. disconnect) you, if not k-line or g-line you for excessive clones.

To run this program:

1. Select the type of flood you would like the clones to do.
2. Enter the target nick/channel of the flood.
3. Select the number of clones to load.
4. Select the IRC servers to use. You can enter as many as you want but you must enter at least one. Note that the bots will be spread out over these servers. If you load 20 bots onto only 2 different servers, you will have 10 on each and will probably get k-lined. If possible, try to only load 1 bot per server.
5. Click **Start**. The bots will load, do their deeds, then disconnect.

Credits: this program runs fb.exe by Dr. Bardo, however, it is hidden in the background so you'll never see it.

That's it!
