

# Connection Monitor

This program monitors all connections to your computer and requires no special version of Winsock. To use it:

1. Select to auto-scan or scan once. Available options will be enabled if they are available with the scan option you chose.
2. If its enabled, you can select the scan time delay.
3. If its enabled, you can select to alert on new connection.
4. If you selected to alert on new connection, you can make it bring up a message box or echo to Little Star.
5. Click "Begin Scan". Connected IPs will be shown in the IP box.

To resolve an IP, select it and click **Resolve** (or double-click on the IP). The IP will be resolved, and, if there is a nick who matches the IP or the host.domain address on any of the same channels as you, it will appear in the nick box.

If you are echoing to Little Star, the resolution and nick matching will occur automatically.

Note that this utility finds all connections, and can be quite annoying if you're cruising the web!

That's it!
